

DURAND Gearboxes

CMD

NOISELESS

The worm gears operate with a high sliding speed, associated with a large gear overlapping ratio, which makes this type of gear the most silent gear transmission.

STURDY

The high stiffness of the housing, together with the use of largely sized quality components provides the users with the most robust generation of worm gear units. CMD Durand gear units are designed to transmit high torques within limited room.

EASY MAINTENANCE

The simple design, associated with easy access to all components reduce drastically the maintenance costs.

CMD can specify the selection of lubricant together with maintenance recommendations.

COMPACTNESS

The compactness of the CMD Durand gear units is an advantage for many applications. They have been designed with the aim at reducing the overall dimensions:

- right angle arrangement of the shafts
 - hollow shaft design
 - large ratios within a compact volume.

ACCURATE

Nowadays, gear cutting and grinding machines allow the production of high accuracy gears having very low pitch deviation and accurate profile. Great positioning is therefore achievable for applications such as robotics, machine tools, printing machine, etc.

PROCESS MONITORING

CMD has developed a simple system which monitors the absorbed power of the driven machine on a continuous basis.

Applications	p. 41-52

The **CMD Durand technology** is constantly evolving and being optimised, thanks to several decades of experience in cooperation with the end users.

CMD is considered as a specialist for medium and large size of worm gears and offers a wide range of worm gearboxes that complies with very demanding industrial applications: metal, sugar, cement, waste recycling, environment, material handling, machine tools industries...

Whenever the standard range is not adapted, CMD can modify the standard design or provide a custom design to comply with specific requirements: high accuracy, high torques, specific dimensions, specific kinematic design...

This catalogue describes in details the N series, from size 160 to 500, the type F or FN (hollow output shaft) and the type C or FNC (solid output shaft) as well as the range of large reducers JUMBOFLEX sizes 550 to 1250.

Large reduction ratios are made possible by combining several reducers.

Various accessories such as reaction torque arms, temperature sensors, torque and load sensors, couplings... are available to adapt the standard units to customer's requirements.

Method of selection, mechanical and thermal nominal ratings are given for N series reducers.

For customers that will to integrate worm gear set in their machine, we recommend that selection is made using catalogue center distance and ratio. However, CMD also manufacture specific centre distance and gear ratio in order to meet specific requirements – please consult CMD.

GEARS

CMD Durand as a specialist of worm gears, has selected the A profile (DIN3975) for optimising the length of contact, Hertz contact pressures and lubrication.

The torque rating is calculated in accordance with BS721-Durand standard.

Thermal rating is calculated in consideration of the design parameters and the performances of lubricants that have been tested on CMD Durand test bench.

The worm shaft is made of alloyed steel forgings, its threads are case carburised and ground on CNC machines of the latest generation, warranting very high accuracy.

The worm wheel teeth are made of high mechanical properties and low friction bronze.

Gear contact pattern is simulated on computer in order to optimise the oil film thickness and the adaptation of the teeth surfaces under load from the very first running hours.

HOUSING

The very compact housings are made of high quality cast iron GSL, GJS or cast steel GE 280 for specific applications.

Robust design allows the unit to withstand high internal and external loads. The internal arrangement of the housing insures automatic lubrication of bearings.

The housing allows multiple position mounting and accommodates various optional items.

BEARINGS

CMD Durand has a long experience in using roller bearings that withstand the thrust loads generated by worm gears. These bearings are also selected to withstand the external loads (radial, axial...) that vary from one application to another. The selection of bearings and their mounting arrangement insure optimal gear meshing.

LUBRICATION

CMD Durand has tested both test bench and at site a large number of synthetic and mineral oils which results have been used to determine the ratings given in this catalogue.

CMD Durand gear units that are lubricated by synthetic Polyglycol oils offer the highest performances in terms of transmitted power, efficiency and durability. For most of applications, splashing lubrication is sufficient enough.

For applications which require oil circulation and injection, CMD provides a complete lubrication system inclusive of pumps, monitoring and accessories.

Because of the running position of the reducer and due to low speed operation, bearings are sometimes lubricated by EP grease.

Note: CMD Durand provides general or specific lubrication instructions.

SEALING

Joint sealants compatible with Polyglycol synthetic oils are used for sealing joint faces.

The sealing of the rotating parts is performed by standard Nitrile or Viton seal rings.

COUPLINGS

CMD Durand worm gearboxes can be fitted with flexible grid couplings Winflex 9000 and/or Flexident crown gear couplings.

CMD catalogues for couplings are available upon request.

Winflex

Flexident

QUALITY CONTROL

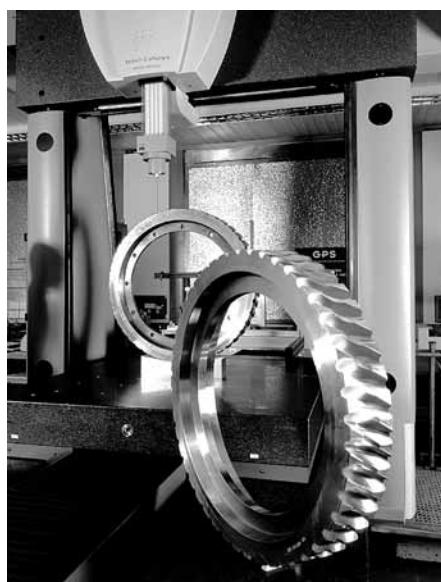

All our products benefit from the following permanent checking:

- raw material / bought in material inspection
- incoming goods inspection
- manufacturing inspections
- gear teeth contact pattern inspection
- final dimensional inspection
- final inspection with running test
- protective packing in accordance with ISO 9001:2000

ACCESSORIES AND OPTIONS

Numerous accessories and optional items can be supplied to fit our CMD Durand reducers, such as:

- special hollow shaft
- double output shaft with standard or custom dimension
- shrink disk arrangement for hollow shaft
- reaction torque arm
- shock absorber (with safety switch)
- torque, temperature sensors etc...
- backstop, free wheel
- lubrication system with accessories
- mechanical fan, heat exchanger
- flange for motors
- special centre distance and gear ratios

 For selection of Reducers (2) (3) (4) consult CMD
 Reversibility and self-locking class refer to page 8

1. Selection of the gear ratio

u = High Speed shaft rotation speed, N1 (HS) / Low Speed shaft rotation speed, N2 (LS).

The rating selection tables, pages 11-13 and 17-19, provide the standard gear ratios.

$$u = N_1 / N_2$$

Note: for final selection of gear ratio, it is required to check that the reversibility condition is in conformity with the application page 8.

2. Selection of the service factor SF

The service factor SF is determined according to the application and the service conditions. For a large number of application, SF is calculated on the tables provided on page 7.

$$SF = F_A \times F_H \times F_L \times F_D$$

3. Calculation of the required torque rating

The required torque rating Mts equals the transmitted torque M2 multiplied by the service factor SF:

$$Mts = M2 \times SF$$

4. Reducer size selection

Select in the mechanical ratings table the standard ratio which is the closest to the calculated ratio obtained in 1.

On the line corresponding to the chosen gear ratio and to the input speed N1, select the size of the reducer having a torque rating Mt2 equals to, or higher than the calculated torque (paragraph 3). Check that the following condition is fulfilled:

$$Mt2 \geq Mts$$

5. Checking of reducer thermal power

The thermal power of the running reducer equals the absorbed power time series of factors provided page 7.

$$Pths = P_a \times F_T \times F_M \times F_P$$

Allowable thermal power Pth is given on the lower table of the page corresponding to selected reducer page 4.

On the line corresponding to the chosen gear ratio u and to the input speed N1, check the value of Pth (without fan), Pthv (with fan) or Pthc (with lubrication circuit), and verify that:

$$Pth \geq Pths$$

$$Pthv \geq Pths \text{ (N range)}$$

$$Pthc \geq Pths \text{ (Jumboflex)}$$

6. Checking of maximum permissible torque

The maximum permissible peak torque Co at the output shaft of the reducer, inclusive of inertias, must be higher than the maximum peak torque of the application M2maxi.

$$Co > M2maxi$$

Note:

In the specific case of power transmission using several reducers simultaneously, it is recommended to apply a correction factor Fr that takes into account the unequal load sharing on each reducer (example: travel drive, cranes...).

Fr = 1.15 to 1.3 in case of drive with 2 to 4 reducers.

Fr = 1.3 to 1.6 in case of drive with more than 4 reducers.

SERVICE FACTOR SF FOR MECHANICAL RATING SELECTION

$$SF = F_A \times F_H \times F_L \times F_D$$

Service conditions	Driven machines
Uniform U	Screw conveyors – Belt or bucket conveyors with uniform loading – Light elevators – Travel drive for machine tools – Shearing press driving gears – Sheet cutting drives – Generators – Packing machines – Mixers for light liquids or homogeneous materials – Light centrifugal pumps – Fans.
Light shocks L	Calanders – Heavy centrifugal machines – Main drives for machine tools – Belt or bucket conveyors with non-uniform loading, for instance mixed materials – Heavy elevators – Cranes slewing drives – Extruders – Rotary kilns – Strip mills (continuous mill for zinc plates, aluminium angle bars and plates) – Mixers for heavy liquids or non-homogeneous materials – Centrifugal pumps – Processing pumps – Piston pumps – Industrial and mining fans.
Medium shocks M	Light ball mills – Lifting gears – Rubber extruders – Blooming mills – Wood processing machines (multiple blade sawing machines, rough turning machines) – Intermittent operation mixers for rubber and plastic materials – Single cylinder pumps.
Heavy shocks H	Roller mills – Heavy vertical mills – Pellet wheel drives – Mining screens – Quarry and mining crushers – Dredges – Bucket elevators – Heavy plates shearing machines – Peeling machines – Cold rolling mills – Heavy drilling machines – Steel processing machines – Heavy rubber mixers – Heavy processing pumps – Brick extruders – Bucket wheels.

Application factor F_A

Daily duty cycles

Hours	U	L	M	H
3≤h<8	0.8	1	1.25	1.50
8≤h≤12	1	1.25	1.50	1.75
h>12	1.25	1.50	1.75	2

Life factor F_H

Required service life	F_H	Required service life	F_H
8000 h	0.70	50000 h	1.25
10000 h	0.75	75000 h	1.43
25000 h	1	100000 h	1.57

Lubricant factor F_L

Synthetic oil PolyGlycol	1
Mineral oil EP	1.25

Starting condition factor F_D

Number of starts or reversings per hour					
Starts/h	10	100	200	300	400
F_D	1	1.1	1.15	1.2	1.3

THERMAL RATING FACTORS

Ambient temperature factor F_T

is related to the ambient temperature and type of lubricant

Ambient temp. Oil type	°C	0	10	20	30	40	50
Synthetic oil PolyGlycol	F_T	0.78	0.87	1	1.16	1.40	1.75
Mineral oil EP	F_T	1	1.14	1.33	1.60	2	2.70

Loading cycle factor F_M

is related to the ratio:

$$\% = (\text{total operation time under load during one cycle} / \text{total cycle time}) \times 100$$

%	100	80	60	40	20
F_M	1	0.90	0.80	0.70	0.60

Operating position factor F_P

is related to the position of the high speed shaft and the output shaft relatively to the ground.

Reducer position	S	G	D	I	V
F_P	1	1	1	1.15	1.25

Operating as a speed reducer:

The worm shaft is driving the wheel connected to the driven machine. The power is transmitted by the worm shaft to the wheel.

Operating as speed increaser:

The worm wheel is driving and transmit power to the worm shaft.

Reversibility:

This property is applicable for both directions of rotation. Operation as speed increaser in this case is possible. Reversibility allows the driven load to become the driving element (for instance, slowing down an heavy inertia machine).

Self-locking:

This property is applicable for both direction of rotation. Operation as speed increaser in this case is impossible. Self locking prevents the driven load from becoming a driving element: this safety condition is required for lifting application (for instance).

In stopped condition the self-locking is called "**static self-locking**" whereas in running conditions is called "**dynamic self-locking**".

In case of dynamic self-locking, if the driven load becomes the driving element, the reducer will stop running, immediately or after a very short while, depending on the resisting torques in the drive chain. The complete dynamic self-locking condition is practically never reached, unless in the specific case of high ratios and speeds close to zero.

Reversibility class

The table below is to be used for the selection of the gear ratio of the reducer which is required to fulfil the reversibility or self-locking condition. For specific cases, please consult CMD.

Reversibility class table		Maximum thread angle for each reversibility class, depending on reduction ratio and centre distance.								
Class #	Definition	Class	u / size	160	200	250	315	400	450	500
1	Full static and dynamic reversibility	1	5	39	41	41				
			7.5	29	31	31	34	41	39	41
2	Static and dynamic reversibility	2	10	23	24	26	28	31	32	31
	Fast reverse effect		12.5	19	21	20	23	26	29	27
3	Poor static reversibility	3	15	16	17	16	20	22	24	24
	Dynamic reversibility		20	12	13	13	15	17	18	18
4	Fast reverse effect under vibrations	4	25	9	9	10	12	14	14	14
	Poor dynamic reversibility (*)		30	8	9	8	10	11	13	12
5	Static self-locking	5	40	6	6	7	8	8	9	9
	Fast reverse effect under vibrations		50	4	5	5	6	7	8	8
	Very poor dynamic reversibility (*)		60	4	4	4	5	6	6	7

(*) relative to worm shaft rotation (low speed)

♦ for larger sizes, consult CMD

Note: for standard applications where reversibility is required, we recommend classes 1 and 2. When full static self-locking is required, select classes 4 and 5 and install a safety brake. For multi reduction reducers, the reversibility ability of the whole drive is achieved if all reducers are reversible. The self-locking ability is achieved if the larger unit is self-locking (preferably, the smaller units should be self-locking as well).

Efficiency

For a given ratio, the efficiency increases with the size of the gearbox, the sliding velocity (worm shaft speed) and the lead angle. Polyglycol synthetic oil also provides optimum efficiency.

The efficiency η_R of the reducer lubricated with synthetic polyglycol lubricant can be estimated as follows:

$$\eta_R = \frac{M_{t2} \cdot N_2}{9550 \cdot P_1}$$

M_{t2} output torque (N.m)
N₂ output shaft rotation (rpm)
P₁ input power on worm shaft (kW)

Example:

- application: conveyor drive
- 24h continuous duty, uniform load
- ambient temperature 30°C
- motor rating 55 kW @ 1500 rpm
- output shaft rotation N2 = 47 rpm
- absorbed power Pa = 52 kW @ 1480 rpm
- efficiency η = 0.93
- output torque M2 = 9830 Nm
- required life 50000 hrs
- maximum output peak torque M2 maxi = 25000 Nm
- operating position: S (the worm shaft is horizontal, above the worm wheel)
- lubricant: Polyglycol synthetic oil PG

1) Gear ratio u

$$u = N1 / N2 = 1480 / 47 = 31.5$$

Select exact ratio 30 refer to page 12
(Standard gear ratio refer to page 29)

2) Service factor SF

$$SF = F_A \times F_H \times F_L \times F_D$$

$$F_A = 1.25 \quad F_H = 1.25 \quad F_L = 1 \quad F_D = 1$$

$$SF = 1.25 \times 1.25 \times 1 \times 1 = 1.56$$

3) Selection torque

$$Mts = M2 \times SF = 9830 \times 1.56 = 15\,335 \text{ Nm}$$

4) Sizing of the reducer

Select the size of the reducer from the mechanical power ratings table, on pages 11 to 13.

For $u = 30$ and $N1 = 1500$, the size 315 is selected, on page 12.

The condition $Mt2 > MtS$ is fulfilled.

5) Thermal power rating

The required thermal rating is

$$Pths = Pa \times F_T \times F_M \times F_P$$

$$\text{Facteurs } F_T = 1.16 \quad F_M = 1 \quad F_P = 1$$

$$Pths = 52 \times 1.16 \times 1 \times 1 = 60.3 \text{ kW}$$

The power rating is indicated in the table on the bottom of page 12. The thermal rating for gearbox 315, ratio 30 is $Pthv = 62 \text{ kW} @ 1500 \text{ rpm}$ with fan.

The condition $Pthv > Pths$ is fulfilled.

6) Verification of the maximum peak torque on the output shaft: Co

Refer to Co table on page 29: for unit size 315 and gear ratio 30, the maximum admissible peak torque Co is 51130 Nm which is higher than the required 25000 Nm.

The condition $Co > M2maxi$ is fulfilled.

Worm gear units – N range

Sizes from 160 to 500

Worm gear units N range sizes 160 F/C to 500 F/C Type

Mechanical power ratings P1 in kW, Output torque Mt2 in Nm, worm shaft rotation speed N1 and worm wheel rotation speed N2 in rpm, Service factor = 1, design life = 25000 h, polyglycol synthetic oil, Fp = 1, Fm = 1.

* Mounting bases dimensions.

** Dimension H indicates the overall dimension when there is no second shaft extension.

Other dimensions of low speed shaft are possible upon request. C type reducer is a F type reducer having the hollow shaft filled up with solid shaft.

(1) 4 holes ØJ for sizes 160 to 315
8 holes ØJ for sizes 400 to 500

(2) 4 holes ØJ for sizes 160 to 250
8 holes ØJ for sizes 315 to 500

Function

- Withstand the reaction on the output shaft and provide load damping. Load is estimated by measuring the shock absorber load variation (L_1, L_2, \dots).
- Vibration damper and shock absorber.
- Safety: safety and alarm switch(es) for motor power cut off.
- Double way damping: compression and tension.

Designation

- CMD shock absorber is first designated by O, I or II referring to its dimension, see table 2. The following number is the first step switch off load (in daN). The letter C indicates that this is the latest version.
- Admissible loads

L_0 = centre distance between fastening pins at rest position

P_0 = preloading. This load does not affect the length L_0

P_1 = minimum load for activation of the switch, corresponds to L_1

P_2 = maximum load for adjustment of the switch in case of repeated shocks, with frequency higher than 30 per hour, corresponds to L_2

P_3 = maximum load for adjustment of the switch in case of repeated shocks, with frequency lower than 30 per hour, corresponds to L_3

P_4 = maximum load for adjustment of the switch in case of continuous loading, without shocks, corresponds to L_4

Maximum admissible output peak torque Co can be reached occasionally, specifically during starting or braking phases, taking into account all inertias of the drive system.

Before being packed and dispatched, CMD gearboxes are submitted to a bench test as well as a conformity test in accordance with customer specifications.

Installation

When couplings are used for the shaft connection between the reducer and the motor and/or machine, during positioning, the shafts should be carefully aligned, following the instructions for mounting the couplings Winflex and Flexident.

In case of heat exposure, it is advised to install a protective screen.

Lubrification

Technical manual B-11-4303 for "lubrication, commissioning, maintenance and storage of worm gears" is supplied with all the delivered units.

Data sheet B-11-4304 indicates the lubricants recommended by CMD Durand.

Our units are supplied without oil, and it is therefore the responsibility of the user to fill them with the correct amount of oil required for operation. Refer to technical manual B-11-4303, for standard applications. In some cases, CMD may supply a specific manual which must be followed.

For most applications, we recommend the use of synthetic oil PolyGlycol, of grade 220 (220 cSt at 40°C), dedicated to gear lubrication. For heavy duty applications heavy loads at low speed: the oil viscosity has to be higher – follow the specific instructions for the application or consult CMD.

Bearings are lubricated with oil or EP grease, depending on the speeds and operating position of the reducer. In most cases, color stickers indicate the filling plugs, level plugs and drain plugs.

Commissioning

It is recommended that during the commissioning of any gearbox the unit is put under load progressively, in order to ease the contact pattern adaptation. This specification is highly recommended for applications where the reducer is fully loaded at start (wire mills, extruding machines, lifting...).

When the reducer is lubricated with an external lubrication system, that unit must be started before starting the reducer itself, in order to insure a proper lubrication of the gears and bearings well before the reducer is put under load.

Storing

The internal components of the reducer are protected by a layer of the lubricant used for testing, and anti-corrosion substance, suitable for up to 3 months protection.

The outside non coated surfaces of the reducers are covered with a protective film.

For longer storage period or in case of harsh climatic conditions, extra care must be taken, please inquire CMD.

The reducer must be stored in a dry place, where the temperature shall be over 5°C in all circumstances. The floor must be free from vibrations.

Worm Gear Sets

For more than 60 years, CMD Durand has been known as the specialist of worm gears. CMD Durand designs and supplies a wide range of worm gears of high quality for numerous applications in the mechanical as well as the precision industries. The worm shafts and the worm wheels are designed according to CMD standard within accuracy class required.

The technology and dimensions of the gears are those of CMD Durand standard reducers. CMD Durand may as well offer specific gears in accordance with client specific construction (centre distances, gear ratios, gearing backlash and precision).

The required accuracy level is guaranteed by the manufacturing process, based on CNC machines and internal quality control system.

CMD standard and dimensions

- Standard range of centre distance:
50, 63, 80, 100, 125, 200, 250, 280, 315, 355, 400, 450, 500, 560, 630, 710, 800, 900, 1000, 1120, 1250
- Standard ratios:
5, 7.5, 10, 12.5, 15, 20, 25, 30, 40, 50, 60
- Gearing accuracy class in accordance with DIN 3974, ISO 1328:
Grade: 7 (general machinery)
Grade: 3 4 5 6 (accurate machinery)
- Axial module: 1 to 36 mm
- Worm shaft made of alloyed steel, thread being heat treated (induction, case carburised or nitriding), the threads are finished on Klingelnberg or Durand grinding machines.
- The worm wheel is made out of dye cast (GK, GM) or centrifugal (GZ) nickel bronze, in order to get the highest possible mechanical properties and durability.

Special worm gear sets – CMD capacities

- Worm outside diameter: 30 to 420 mm
- Worm Wheel outside diameter: 50 to 3000 mm

Center distance, gear ratio and size of the customer equipment can be specific and defined according to customer specification and drawings.

Center distance: 30 to 1600 mm

Gear ratio: according to customer request

Worm shaft and worm wheel material according to customer request

Specific backlash or adjustable backlash (CMD Y Type)

Adjustable backlash worm set – Y Type

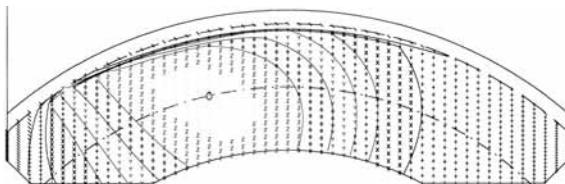

Thanks to its own design software, **CMD** can work out specific gear designs, of any size, in accordance to customer's requirements.

The contact pattern of the worm gear teeth is simulated on a computer, in accordance with the **CMD** standards. A specific contact pattern, in location and area, can be achieved in order to respond to specific demands.

The gear cutting process used on CNC Pfauter or Durand machines allows to achieve the best contact pattern for oil film formation as well as optimal adaptation of the working teeth flanks under load, which is effective from the first hours.

Durand worm gears are controlled in accordance to QA standards, guaranteeing the required accuracy class.

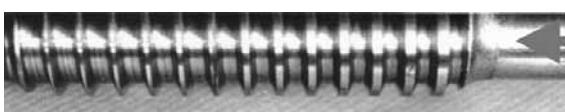

When the angular clearance of the gearbox is specified, and possibly has to be adjusted during the time period of operation, the **CMD Y** type worm set is the solution.

The **CMD Y** type worm set backlash is adjustable. Its gear cutting quality is of a high grade, and allows a very smooth and constant power transmission.

Adjustment of the CMD Y Type worm set backlash

For each axial position of the worm shaft, the worm set has a different backlash value. This backlash is constant when the worm shaft rotates. The bearings special arrangement makes the adjustment easy.

Application examples

Power transmission under high vibration conditions Coal mills

Nearly 600 **CMD** large worm gear sets are currently in operation on vertical coal mills manufactured by BHEL, ANSALDO and ALSTOM. These mills are used in power plants and mills. The **CMD** worm sets drive the table onto which the rollers or balls are milling the material.

Technical specifications:

- A wide range of center distance 27" to 54" (686 to 1372 mm)
- Ratio from 10/1 to 20/1
- Transmitted power from 300kW @ 1000rpm to 600kW @ 600rpm
- Design life = 100 000 hours, based on continuous 24h/24 running
- Accuracy class DIN 7
- Worm is made of alloy forging steel, case carburised and ground
- High tensile centrifugal bronze casting is used for the worm

Voith photo

Power transmission in a distorted structure

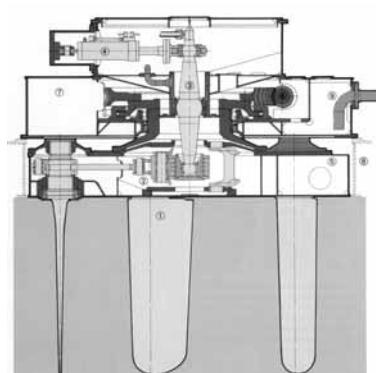

VOITH has selected **CMD** to supply large worm sets driving its marine propellers. This choice was made because of the severe running conditions under which a very high precision level must be achieved:

- 1- very low noise level, demanding gear accuracy class DIN 5 for the shaft and DIN 6 for the wheel (OD 1625 mm).
- 2- The contact pattern of the worm set (its position and area), tested in **CMD** manufacturing plant without load, was first defined and simulated according to the optimised final contact pattern required under the nominal application load.

In order to simulate the evolution of the contact pattern according to the load, **CMD** had to take into account the displacement of the wheel vs the shaft. This displacement is due to the forces acting onto the vertical blades during the vessel propelling, and to the vessel structure deformation.

Technical characteristics:

- Center distance from 670 to 900 mm
- Reduction ratio from 9 to 14
- Transmitted power from 500kW @ 1200 rpm to 900 kW @ 810 rpm
- Gear teeth accuracy class DIN 5 for the worm shaft, DIN 6 for the wheel
- Worm shaft is made of alloy forging steel, case carburised and ground: outside diameter from 200 to 300 mm
- High tensile centrifugal bronze casting is used for the worm wheels which can have an outside diameter from 1220 to 1625 mm

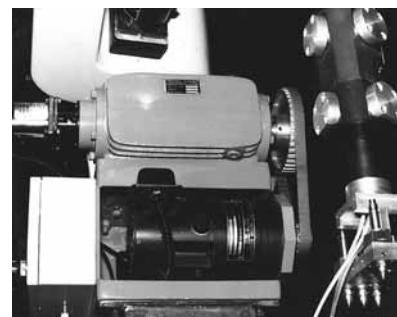

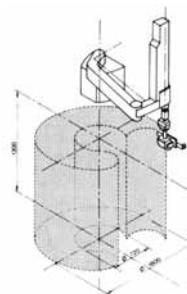

Fast moving positioning – Handling robots

The French company Allibert mounts handling robots on its plastic objects moulding dyes. These robots are used to extract the pieces from the dye, and position them for various operations (finishing, control, packing...). These robots use **CMD** JR type worm sets.

The **CMD** JR type worm set is designed with a reduced teeth backlash. It drives the main rotation shaft of the robot with an inching motor. The worm shaft is connected to an incoder, controlling the shaft position.

Albora photo

Technical characteristics:

- Center distance 100 to 160 mm
- Reduction ratio from 60/1 to 100/1
- Gear backlash 0.036 to 0.058 mm
- Kinematic angle tolerance of the drive shaft: 1.5 to 2 minutes
- Number of cycles: 200 to 600 per hour

Precision positioning – radar antenna drives

The French radio astronomy center of Nancay (France) – world fame for astronomy research – uses many antennae for sun observation. A very high kinematic precision is requested for these antennas drives.

The antennae rotation drives use **CMD** Durand 0 backlash worm sets. They are mounted into **CMD** specifically designed housings.

Technical data:

- Center distance 125 mm
- Reduction ratio 60/1
- Continuous running 24h/24, 1 rotation per day

Another application – Drive systems for satellite trackers

2 worm gear screw packs monitor the orientation and the elevation of the trackers.

Technical data:

Elevation worm gear screw pack

- Reduction ratio 280/1, power 1.1 / 4.9 kW at 655 / 2670 rpm
- Stroke 2 790 mm, speed 110/440 mm/min
- Dynamic load 220 kN, static load 480 kN

Orientation worm gear screw pack:

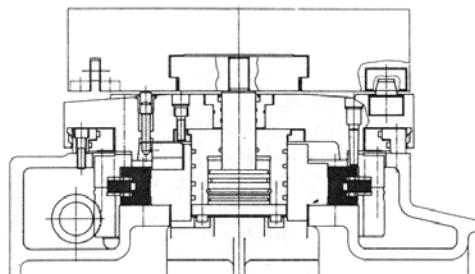

- Reduction ratio 600/1, power 0.37 kW at 1500 rpm
- Stroke 1 300 mm, speed 24 mm/min
- Dynamic load 200 kN, static load 270 kN

Kinematic consistency – Machine tools table drive

CMD Durand designs and manufactures Y type high quality worms set with backlash adjustment for several CNC machines makers (Mazak, Mitsubishi, Huron-Graffenstaden...).

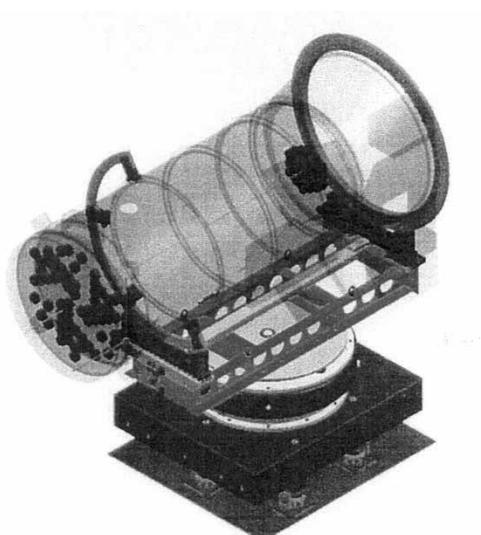

The worm set drives the supporting table. A great kinematic consistency as well as angular position accuracy are demanded.

Mechanical data:

- Center distance 200 to 665 mm
- Reduction ratio 120 to 180/1
- Accuracy class DIN 4

Kinematic precision Dividing table

The CNES (French Space Engineering Centre) has awarded to **CMD** Durand the design and manufacture of CNC dividing tables of a very high precision grade.

The worm set is driving the rotation of a gauging device used for the official approval of a CNES spectrometer.

Technical data:

- Center distance 395 mm • Reduction ratio 120/1- Adjustable backlash Y type worm set • Accuracy class ISO 2
- Rotation speed : 0.2 rpm • Rotation angle +/- 180°

Accuracy:	requested	obtained
Verticality:	$\pm 1''$	$< \pm 1''$
Angle:	$\pm 1''$	$< \pm 1/3'',$ equivalent to 0.0001° , represents less than 1.75 mm on 1 km distance

Applications

Complete range of worm gear sets:

- Worm shaft is made of forging steel, case carburised and finish ground
- Worm wheel is made of high speed centrifugal bronze for sizes:

27" centre distance = 686 mm

36" centre distance = 914 mm

41" centre distance = 1041 mm

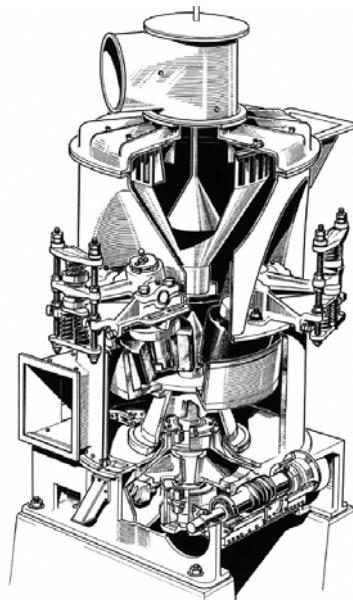

48" centre distance = 1219 mm

54" centre distance = 1371 mm

Gear ratios: 54/5 – 65/4 – 76/5 – 94/5

104/5 – 94/7 and 100/7

Our capacity is limited to 1600 mm centre distance.

Almost 600 **CMD** Durand worm gear sets were delivered for Raymond coal pulverizers to the main world manufacturers. These gears are used in power plants and mills. The milling of the raw material is obtained with suspended rollers, pressed onto the rotating table, which is driven by the CMD Durand worm gear set.

Dual output shaft worm gearbox, multi purpose drive

- Each gearbox has a center distance = 200 mm with a reduction ratio $i = 4$ and is driving 2 cylinders simultaneously. The combination of several gearboxes on the printing machine allows high quality of two-colour and four-colour printing.
- Technical specification: 80kW, output speed 500 rpm, continuous 24h/24 running.
- Each shaft's angular position is fixed against the other's, thanks to an internal clutch system which can be actuated instantly. A second clutch system allows the "inching" running, in order to mount the printing plates onto the cylinders.
- The worm shaft can move axially inside its housing, allowing a compensation of the paper expansion when it is wet. The printing accuracy obtained is +/- 0.03 mm.
- Several sensors integrated in the equipment make sure the system is running safely.

Gear motor, with a vertical output shaft, with guaranteed sealing obtained by internal slinger.

Torque range from 20 000 Nm to 1 000 000 Nm and more.

Very high reduction ratio : I = 10 000/1, ...30 000/1, ...etc.

Output speed ≤ 0.1 rpm

The spline shaft of the clarifier slides into the low speed shaft of the gearbox, enabling the adjustment of the drag scraper's position vs the bottom of the tank. This position is determined by the action of a lifting jack that is able to lift up to 100 tons and more. The position of the jack is monitored by limit switches (mechanical and electrical), and is visually displayed on the gearbox.

Range of geared motors, with 2 or 3 stages of worm gear reduction:

- Cast iron housing
- Continuous (24h/24) running
- Running 3 months per year
- Low Speed shaft torque from 20 000 to 120 000 Nm, speed of 1 rpm
- Torque from 80 000 to 600 000 Nm, speed of 0.4 rpm for the largest gearboxes.

The electrical motor is fixed on the primary stage gearbox. The whole gearbox is floating on the mixer's shaft.

The secondary gearbox's torque is compensated by the torque reaction arm, and shock absorber, which is equipped with:

- either 1 or 2 safety sensors
- or 1 electronic sensor allowing:
 - permanent display of the transmitted torque
 - peak torques memorizing
 - electrical outputs for online monitoring

The simplicity and robustness of the **CMD** Durand worm gearbox guarantee its reliability for this application.

The main functions can be:

- Start a high inertia machine

(Ex: large fan)

- Start and drive at low speed

(Ex: vessel drive shaft, high capacity diesel engines...)

- Start, drive at low speed, position

(Ex: Mills, kilns, conveyors...)

- Start, drive, slow down, stop

(Ex: gas turbine)

**Options:**

- hydraulic coupling for high inertia start.
- One way clutch, gear clutch...
- Telescopic gear coupling, cardan shaft, etc... for compensating the thermal expansion of the driven shaft.
- Braking system.

The center distance between the 2 cylinders of a steel mill is adjusted by a screw jack system, driven by the worm wheel of a worm gearbox. The equipment of a mill can be:

- 2 screw jacks worm gearboxes for the adjustment of the horizontal mill.
- 4 screw jacks worm gearboxes for the adjustment of the vertical mill.

The screw jack worm gearboxes include the following components:

- Steel housing.
- Low speed hub made of steel or GJS cast iron with a large bore and 6 or 8 wide parallel splines.
- Oil injection lubrication.
- The splines are lubricated against sliding heating.

2 opposite gearboxes on the same mill driven by the same motor secure the synchronization. They are connected with a clutch in order to allow parallelism setting.

Housing has to be strong enough in order to cope with:

- The high torque transmitted when unlocking.
- The high axial forces transmitted by the screw when setting under load.

586FSP reducer

Manesmann Demag doc.

Shearing machine

The JUMBOFLEX worm gearbox, size 900, drives the crankshaft/rod system of the 600 tons PINCHART DENY shearing machine.

Technical data:

- Centre distance 900 mm
- Reduction ratio 66
- Dynamic output torque 424 080 Nm at 10 rpm
- Maximum peak torque 1 291 630 Nm
- The oil injection system insures lubrication of the gears and bearings with synthetic oil.

Bull block driving

The "Bull block" worm gearboxes are used to draw the copper and steel tubes to the required dimensions.

The tubes are wound up around a coil mounted on the gearbox low speed shaft. The tube drawing force is obtained by the gearbox output torque, and can reach up to 17 tons for steel tubes.

Technical characteristics:

- Centre distance 610, 630, 800 mm
- Reduction ratio 9 to 17
- Variable output speed from 0 to 525 rpm
- Continuous running 24h/24
- Maximum output torque 129 200 Nm at 29.3 rpm (steel tubes)

The running conditions are extremely severe: the starting load can be very high, and requires a specifically adapted contact pattern in order to have a sufficient oil film at start.

Jumboflex worm gearbox drive (sizes from 560 to 1250)

2 JUMBOFLEX gearboxes drive the crankshaft/rod system of each automotive press, used by German car manufacturers.

Worm gearbox technical data:

- JUMBOFLEX worm gearbox, size 900, weight 7300 kg
- Reduction ratio = 20
- Nominal Output torque 190 000 Nm at 15 rpm
- Maximum output torque 570 000 Nm
- Continuous (24h/24) running. Required service life = 80 000 hours.
- Reduced backlash is required, as well as torsional rigidity of the shafts.

A primary gearbox insures a primary reduction ratio, and speed synchronization between the 2 gearboxes.

The worm gear solution was chosen because of its specific advantages:

- A compact right angle function with a reduction ratio of 20.
- A very high torsional rigidity of the input and output shafts.
- Smoothness of gearing.

ERFURT doc.

JUMBOFLEX reducer

Gear motor range 315C-125UXCB2403 Type

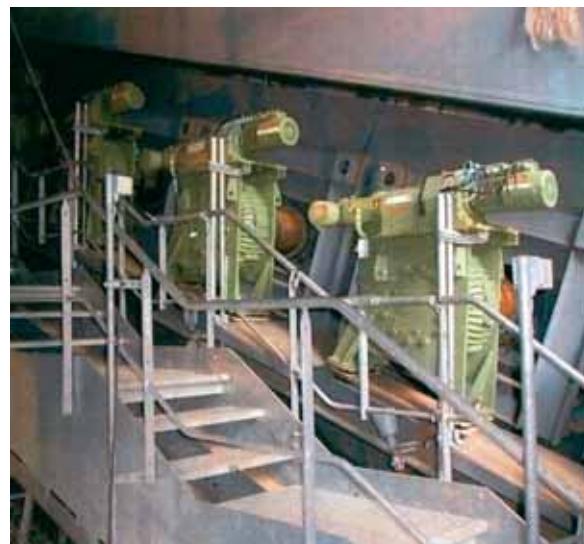

Kiln feeding rollers drives, capacity of 7 tons per hour, 24 hrs daily duty, 365 days per year.

Power 1.5 kW @ 1500 rpm. The motor is equipped with speed variator and speed encoder to enable the speed regulation of each feeding roller.

The reducer is designed with a very high reduction ratio of 27 644. The output speed is from 0.003 to 0.1 rpm (that is 0.2 to 0.6 rph). The maximum output torque is 36 000 Nm.

The following additional functions or devices are also included:

- torque limiter
- output speed control with feedback signal
- manual unlocking device

Steel case gear motors with high reduction ratios (7 000/1 to 12 000/1)

Lifting load on chain up to 70/80 tons. Lifting speed 0.2 m/min.

The gear motors are supplied fully equipped with chain wheel and chain. The chain is designed with a security factor of 5 on nominal load.

Accessories supplied:

- brake motor with manual release
- permanent electronic control of the load on the chain, including:
 - permanent load display
 - four output relays (max load, min load...)
 - 4-20 mA outputs for plc control
- chain limit switches
- control of gate angle
- standby set, comprising portable gear motor and electrical generator

Main drive doubling

Improvement of existing installation:

- 46 cabins of 12 passengers
- 1,500 passengers per hour
- total length 4 942 m, from 880 to 2 360 m
@ speed 6 m/s.

Drive system characteristics:

- there are two main DC motors (1 300 HP @ 1 361 rpm) and one stand-by diesel motor (500 HP @ 1.68 m/s)
- nominal output torque is 320 000 Nm @ 26 rpm. Starting torque is 500 000 Nm
- splash lubrication + cooling circuit
- the transmission is achieved by means of one worm gear reducer type JUMBOFLEX 900F, ratio 61/8, and two primary reducers type ERMASTER R2HC38F, ratio 6.986/1

A special clutch device with double gearing, designed by **CMD**, capable of withstanding the 500 000 Nm output torque, insures transfer from one DC motor to the other in a minimum time.

A security system prevents from any potential mishandling (switching from main to stand-by drive)
