2.3 Dimensional drawings

In this chapter, you can find the dimensions of the gear units as well as example dimensions of the mountable motor adapters.

Dimensions can exceed the specifications of ISO 2768-mK due to casting tolerances or accumulation of individual tolerances.

We reserve the right to make dimensional changes due to ongoing technical development.

You can download 3D models of our standard drives at <http://configurator.stoeber.de>.

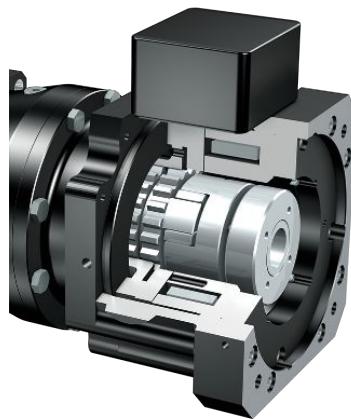

Fig. 1: Motor adapter with ServoStop brake

2.5.2.2 Brake

A failsafe brake is integrated into the motor adapter. It has the function of a holding brake. Braking from full speed, e.g. in case of a voltage drop or an emergency off in hazard situations, is still possible.

The brake can be used as a single brake or together with the motor brake as a redundant brake system.

Function

The brakes installed in the motor adapter are electrically actuated spring-loaded brakes for dry running. In the de-energized state, braking takes place using spring force. The brake is released by an electromagnetic DC coil before the motor is switched on. The switch-on time t_{2B} (release time) is the time until the anchor plate releases from the axially moving brake disc and is magnetically held to the coil body. In this state, the brake is released and the coupling hub can rotate. In order to switch off (motor and brake), the residual magnetic flux of the iron parts (anchor and coil body) must be reduced; the associated time t_{1B} until the start of torque generation is defined as a response delay when linking. The link time t_{1B} is the time until the braking torque has built up to the nominal braking torque.

Manual release

Optionally, the brake can be equipped with a manual release.

Pressing the manual release deactivates the electronic actuation of the brake. Before pressing the manual release, you must establish the safety of the machine (e.g. protection against falling).

2.5.2.3 Electrical connection

- Terminal box (standard)
- Plug connector (optional, not possible in combination with release monitoring)

2.5.2.4 Monitoring

For monitoring the brake system, there are generally two options:

- Manual monitoring of wear via air gap checks with a feeler gauge
- Electrical release monitoring in the terminal box with a non-contact and wear-free proximity switch

2.6 Project configuration

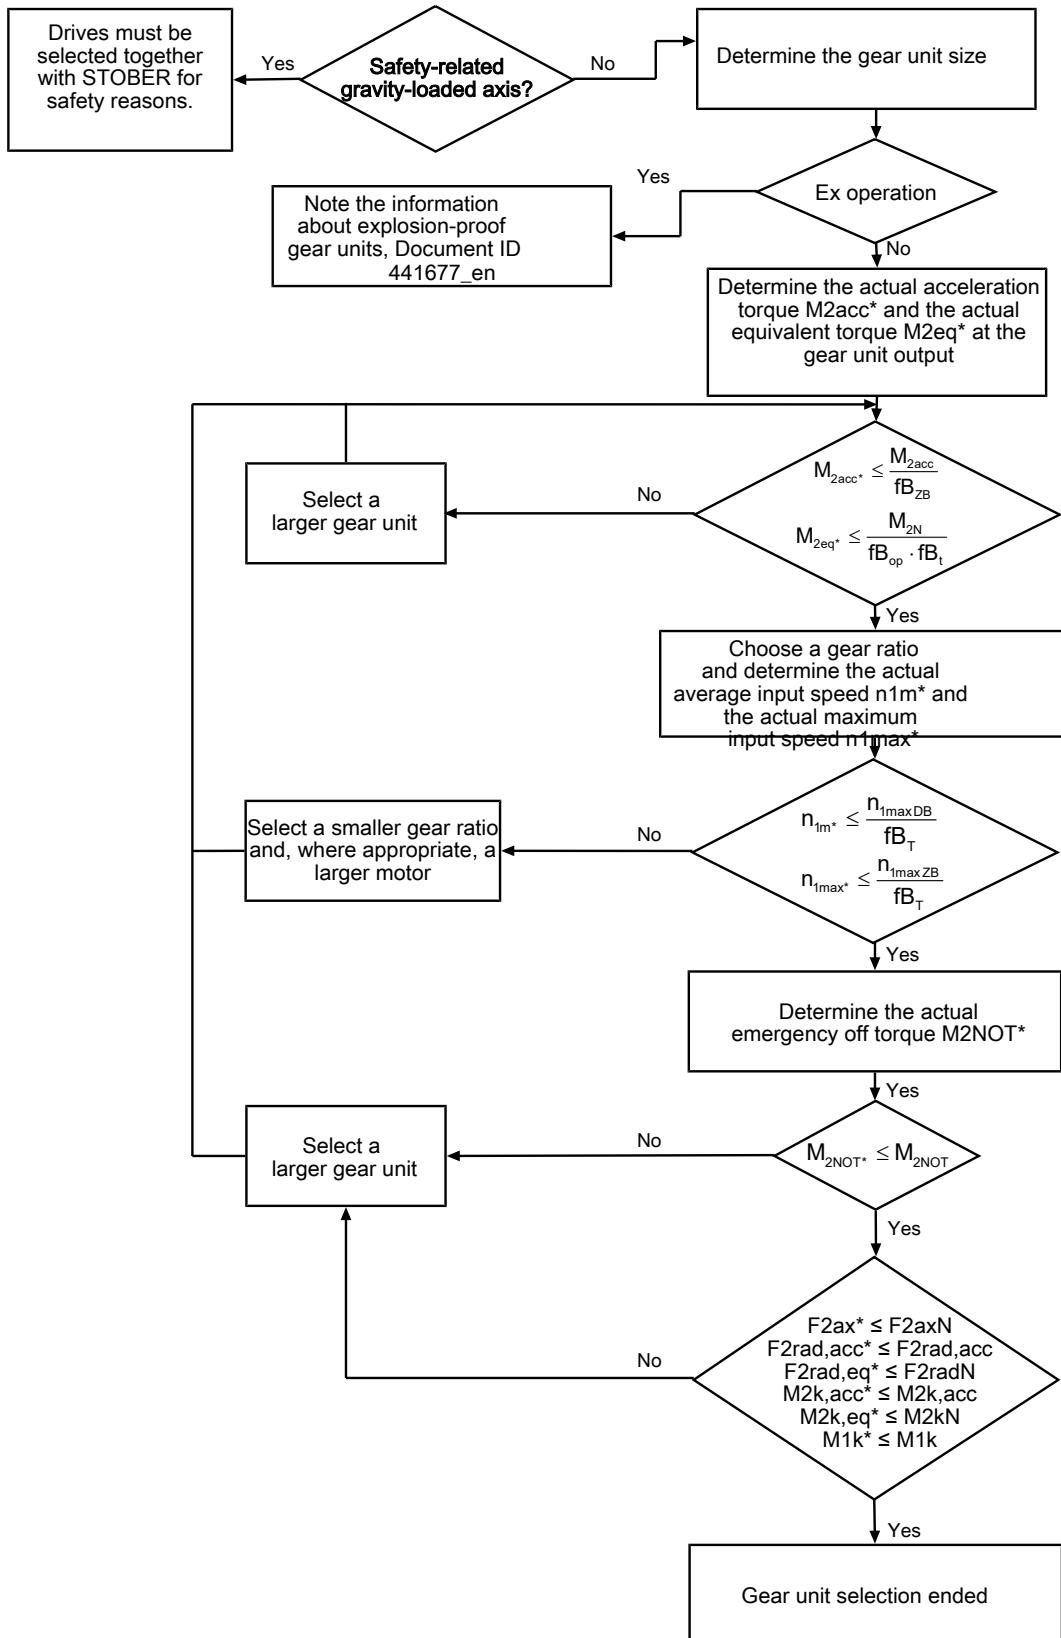

Project your drives using our SERVOsoft designing software. Download SERVOsoft for free at <https://www.stoeber.de/en/ServoSoft>.

Observe the limit conditions in this chapter to ensure a safe design for your drives.

An explanation of the formula symbols can be found in the chapter Formula symbols.

2.6.1 Drive selection

The formula symbols for values actually present in the application are marked with *.

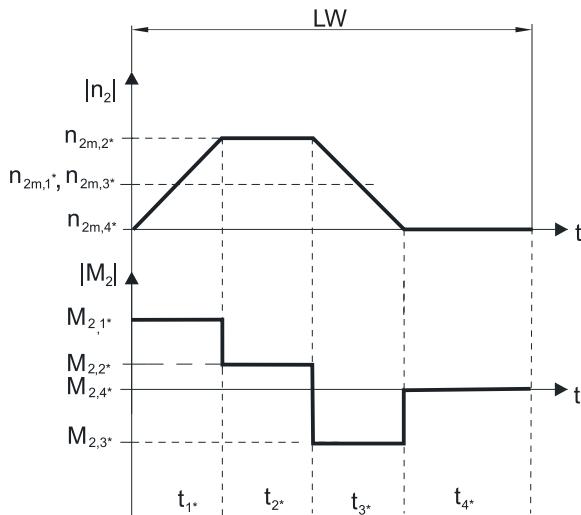

Calculate the forces and tilting torques in the chapter Permitted shaft loads.

Refer to the selection tables for the values for i , $n_{1\text{maxDB}}$, $n_{1\text{maxZB}}$, $M_{2\text{acc}}$ ($M_{2\text{accHT}}$ for reduced backlash), $M_{2\text{NOT}}$ and M_{2N} .

The values for fB_T , fB_{op} , fB_t and fB_ZB can be found in the corresponding tables in this chapter.

Example of cyclic operation

The following calculations are based on a representation of the power taken from the output based in accordance with the following example:

Calculation of the actual maximum acceleration torque

$$M_{2acc^*} = J_{\text{tot}} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual average input speed

$$n_{1m^*} = n_{2m^*} \cdot i$$

$$n_{2m^*} = \frac{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}{t_{1^*} + \dots + t_{n^*}}$$

If $t_{1^*} + \dots + t_{3^*} \geq 6$ min, calculate n_{2m^*} without the rest phase t_{4^*} .

The values for the ratio i can be found in the selection tables.

Calculation of the actual emergency-off torque

$$M_{2NOT^*} = J_{\text{tot}} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual equivalent torque

$$M_{2eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}}$$

2.6.2 Permitted shaft loads for the output shaft

The values specified in the tables apply to the permitted shaft loads:

- For shaft dimensions in accordance with the catalog
- For output speeds $n_{2m^*} \leq 100$ rpm ($F^{2\alpha N} = F_{2ax100}$; $F_{2radN} = F_{2rad100}$; $M_{2kN} = M_{2k100}$)
- Only if radial forces on the gear unit are stabilized by its pilots (housing, flange shaft)

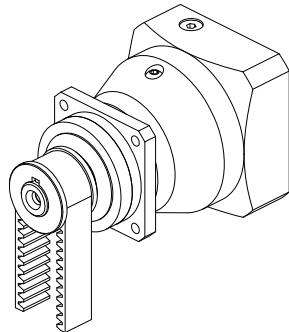

Fig. 4: Recommendation for bearing assignment Z (e.g. for belt drives)

For other output speeds, download diagrams at <http://configurator.stoeber.de>.

The following applies to output speeds $n_{2m^*} > 100$ rpm:

$$F_{2axN} = \frac{F_{2ax100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$F_{2radN} = \frac{F_{2rad100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

The values for F_{2ax100} , $F_{2rad100}$ and M_{2k100} can be found in the table "Permitted shaft loads" in this chapter.

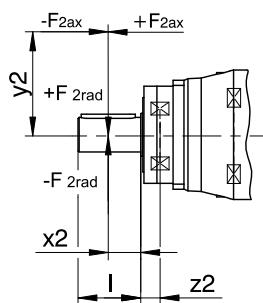

Fig. 5: Force application points

The specified values for $F_{2rad100}$ and $F_{2rad,acc}$ refer to an application of force at the center of the output shaft: $x_2 = l/2$.

Shaft dimensions can be found in the "Dimensional drawings" chapter.

The following applies to other force application points:

$$M_{2k,acc^*} = \frac{2 \cdot F_{2ax^*} \cdot y_2 + F_{2rad,acc^*} \cdot (x_2 + z_2)}{1000} \leq M_{2k,acc}$$

$$F_{2rad,acc^*} \leq F_{2rad,acc}$$

$$F_{2ax^*} \leq F_{2axN}$$

The values for $F_{2rad,acc}$ and $M_{2k,acc}$ can be found in the table "Permitted shaft loads" in this chapter.

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for F_{2ax100} , $F_{2rad100}$ and M_{2k100} by a factor of two.

Also note the calculation for equivalent values:

$$M_{2k,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2k,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2k,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq M_{2kN}$$

$$F_{2rad,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |F_{2rad,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |F_{2rad,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq F_{2radN}$$

The following apply to the bearing service life L_{10h} ($ED_{10} \leq 40\%$):

$L_{10h} > 10000$ h with $1 < M_{2kN}/M_{2k^*} < 1.25$

$L_{10h} > 20000$ h with $1.25 < M_{2kN}/M_{2k^*} < 1.5$

$L_{10h} > 30000$ h with $1.5 < M_{2kN}/M_{2k^*}$

For different duty cycles:

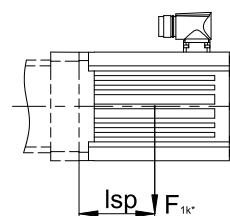

$$L_{10h} > L_{10h(ED_{10}=40\%)} \cdot \frac{40\%}{ED_{10}}$$

2.6.3 Permitted breakdown torques at the gear unit input

For a horizontal mounting position of the motor, verify that the permitted breakdown torque at the gear unit input is not exceeded before installation on a STOBER gear unit. You can find information for how to do that in this chapter.

Calculate the actual breakdown torque as follows:

$$M_{1k^*} = F_{1k^*} \cdot l_{sp} \leq M_{1k}$$

Type	M_{1k} [Nm]

MB33	90
MB43	200
MB53	450

2.6.4 Recommendation for radial shaft seal rings

For a duty cycle > 60% and higher surrounding temperatures, we recommend radial shaft seal rings made of FKM at the output.

Properties:

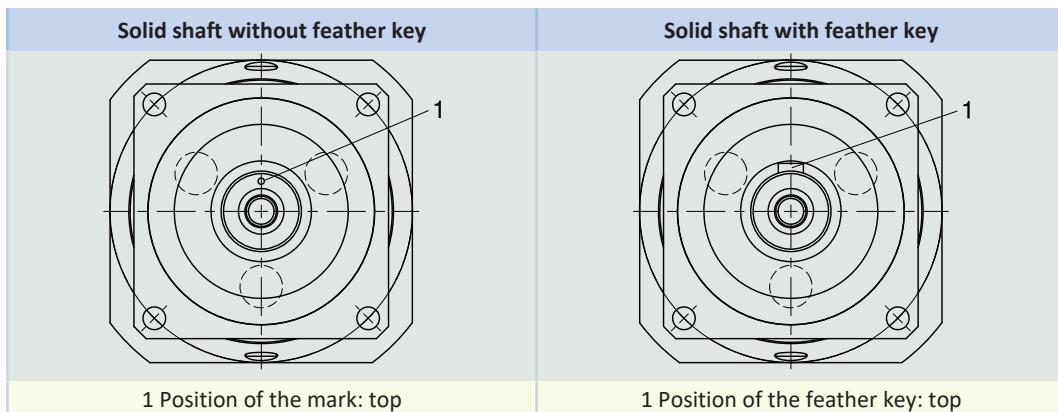

- Excellent temperature resistance
- High chemical stability
- Very good resistance to aging
- Excellent resistance to mineral oils and greases
- For use in the food, beverage and pharmaceutical industries

Leak-proofness

Our gear units are equipped with high-quality radial shaft seal rings and checked for leaks. However, a leak cannot be fully ruled out over the length of use of a gear unit. If you use a gear unit with goods incompatible with the lubricant, you must take measures to prevent direct contact with the gear unit lubricant in case of a leak.

2.6.5 Reverse operation

To ensure lubrication for circulating gearing parts during cyclic reverse operation from $\pm 20^\circ$ to $\pm 90^\circ$ at the output, pay careful attention to the position of the output shaft for the horizontal mounting of the gear unit, as shown in the diagrams below. The images show the center position of reverse operation. Cyclic reverse operation $\leq \pm 20^\circ$ on request.

Notes

- If you use the solid shaft without a feather key (G), you must note the position of the mark during assembly.
- As an alternative, you can use the solid shaft with a feather key (P). In that case, the feather key functions for position orientation. For a backlash-free connection, also use a clamp.

3.3 Dimensional drawings

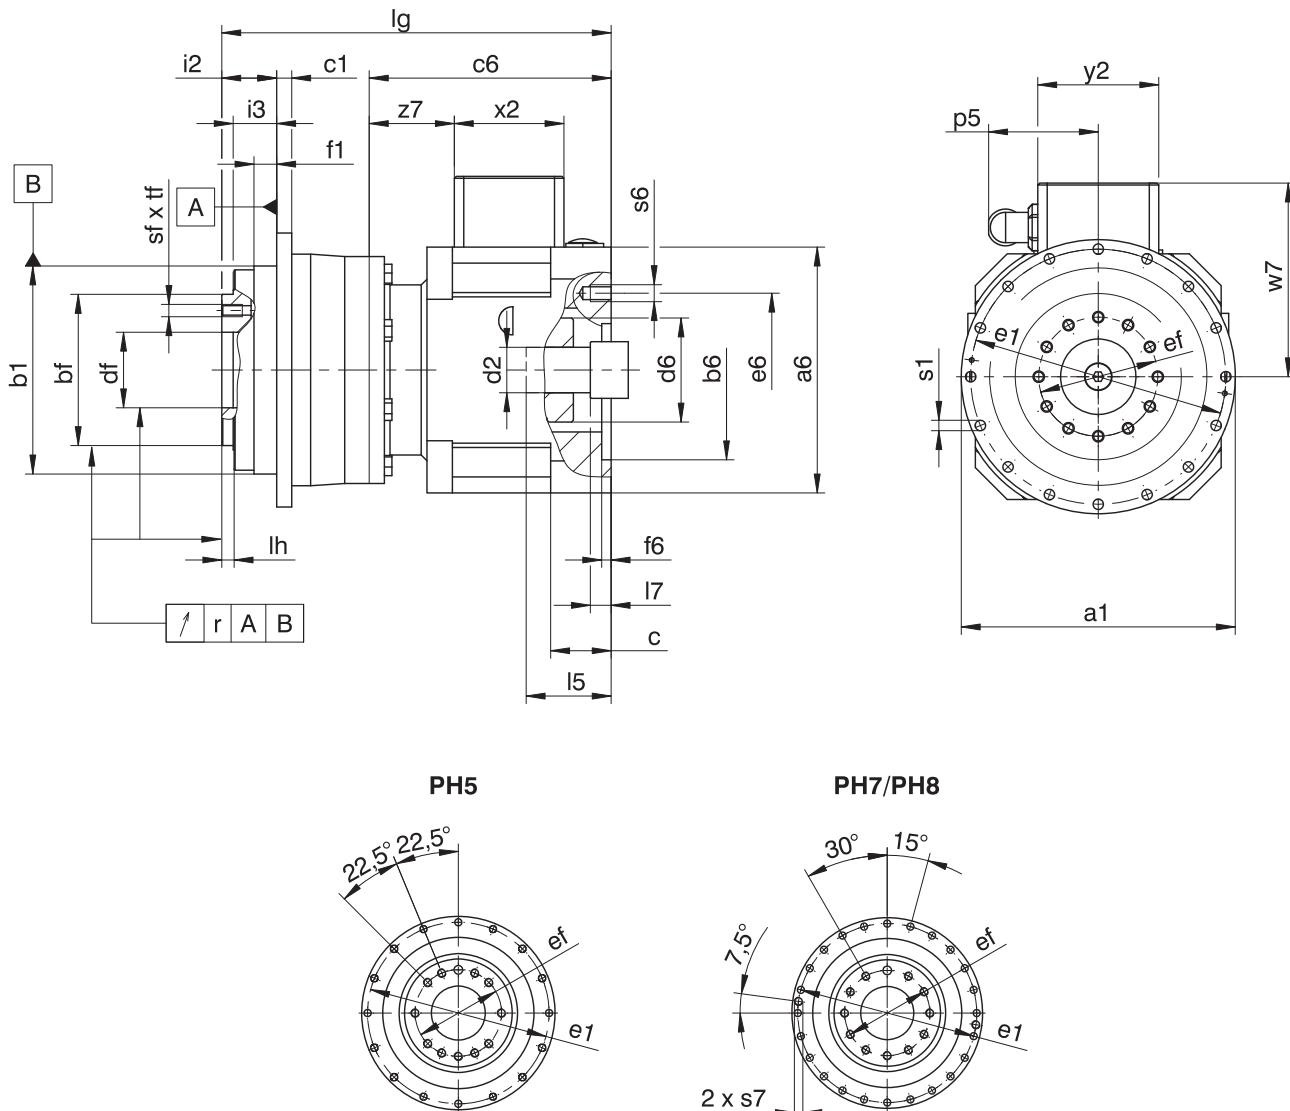

In this chapter, you can find the dimensions of the gear units as well as example dimensions of the mountable motor adapters.

Dimensions can exceed the specifications of ISO 2768-mK due to casting tolerances or accumulation of individual tolerances.

We reserve the right to make dimensional changes due to ongoing technical development.

You can download 3D models of our standard drives at <http://configurator.stoeber.de>.

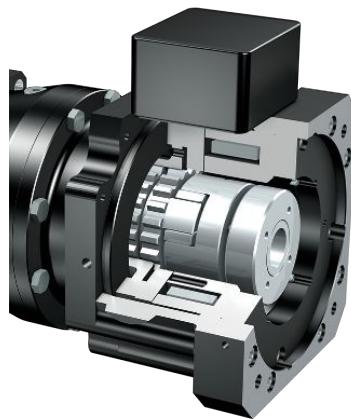

Fig. 1: Motor adapter with ServoStop brake

3.5.2.2 Brake

A failsafe brake is integrated into the motor adapter. It has the function of a holding brake. Braking from full speed, e.g. in case of a voltage drop or an emergency off in hazard situations, is still possible.

The brake can be used as a single brake or together with the motor brake as a redundant brake system.

Function

The brakes installed in the motor adapter are electrically actuated spring-loaded brakes for dry running. In the de-energized state, braking takes place using spring force. The brake is released by an electromagnetic DC coil before the motor is switched on. The switch-on time t_{2B} (release time) is the time until the anchor plate releases from the axially moving brake disc and is magnetically held to the coil body. In this state, the brake is released and the coupling hub can rotate. In order to switch off (motor and brake), the residual magnetic flux of the iron parts (anchor and coil body) must be reduced; the associated time t_{1B} until the start of torque generation is defined as a response delay when linking. The link time t_{1B} is the time until the braking torque has built up to the nominal braking torque.

Manual release

Optionally, the brake can be equipped with a manual release.

Pressing the manual release deactivates the electronic actuation of the brake. Before pressing the manual release, you must establish the safety of the machine (e.g. protection against falling).

3.5.2.3 Electrical connection

- Terminal box (standard)
- Plug connector (optional, not possible in combination with release monitoring)

3.5.2.4 Monitoring

For monitoring the brake system, there are generally two options:

- Manual monitoring of wear via air gap checks with a feeler gauge
- Electrical release monitoring in the terminal box with a non-contact and wear-free proximity switch

Observe the limit conditions in this chapter to ensure a safe design for your drives.

An explanation of the formula symbols can be found in the chapter Formula symbols.

3.6.1 Drive selection

The formula symbols for values actually present in the application are marked with *.

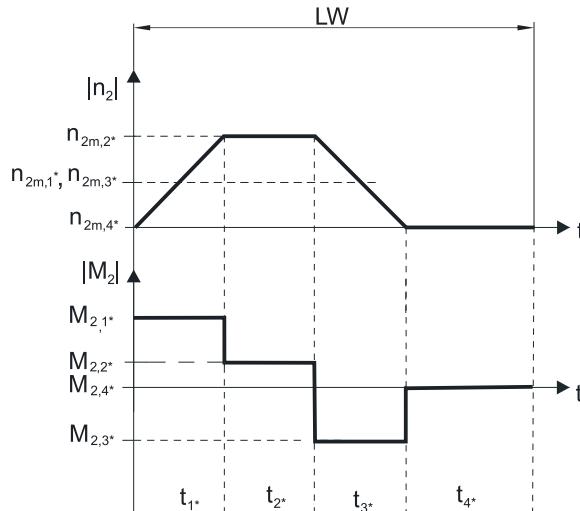

Calculate the forces and tilting torques in the chapter Permitted shaft loads.

Refer to the selection tables for the values for i , $n_{1\max DB}$, $n_{1\max ZB}$, M_{2acc} ($M_{2acc HT}$ for reduced backlash), M_{2NOT} and M_{2N} .

The values for fB_T , fB_{op} , fB_t and fB_{ZB} can be found in the corresponding tables in this chapter.

Example of cyclic operation

The following calculations are based on a representation of the power taken from the output based in accordance with the following example:

Calculation of the actual maximum acceleration torque

$$M_{2acc*} = J_{tot} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_L*$$

Calculation of the actual average input speed

$$n_{1m*} = n_{2m*} \cdot i$$

$$n_{2m*} = \frac{|n_{2m,1*}| \cdot t_{1*} + \dots + |n_{2m,n*}| \cdot t_{n*}}{t_{1*} + \dots + t_{n*}}$$

If $t_{1*} + \dots + t_{3*} \geq 6$ min, calculate n_{2m*} without the rest phase t_{4*} .

The values for the ratio i can be found in the selection tables.

Calculation of the actual emergency-off torque

$$M_{2NOT*} = J_{tot} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_L*$$

Calculation of the actual equivalent torque

$$M_{2eq*} = \sqrt[3]{\frac{|n_{2m,1*}| \cdot t_{1*} \cdot |M_{2,1*}|^3 + \dots + |n_{2m,n*}| \cdot t_{n*} \cdot |M_{2,n*}|^3}{|n_{2m,1*}| \cdot t_{1*} + \dots + |n_{2m,n*}| \cdot t_{n*}}}$$

- For output speeds $n_{2m^*} \leq 100 \text{ rpm}$ ($F_{2axN} = F_{2ax100}$; $F_{2radN} = F_{2rad100}$; $M_{2kN} = M_{2k100}$)
- Only if radial forces on the gear unit are stabilized by its pilots (housing, flange shaft)

For other output speeds, download diagrams at <http://configurator.stoeber.de>.

The following applies to output speeds $n_{2m^*} > 100 \text{ rpm}$:

$$F_{2axN} = \frac{F_{2ax100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$F_{2radN} = \frac{F_{2rad100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

The values for F_{2ax100} , $F_{2rad100}$ and M_{2k100} can be found in the table "Permitted shaft loads" in this chapter.

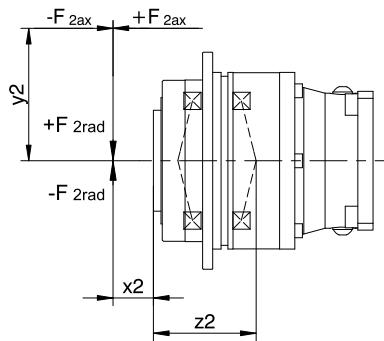

Fig. 2: Force application points

You can determine the permitted radial forces from the permitted breakdown torque M_{2kN} and $M_{2k,acc}$. The actual radial forces may not exceed the permitted radial forces. The permitted radial forces pertain to the shaft end ($x_2 = 0$).

$$M_{2k,acc^*} = \frac{2 \cdot F_{2ax^*} \cdot y_2 + F_{2rad,acc^*} \cdot (x_2 + z_2)}{1000} \leq M_{2k,acc}$$

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for F_{2ax100} , $F_{2rad100}$ and M_{2k100} by a factor of two.

Also note the calculation for equivalent values:

$$M_{2k,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2k,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2k,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq M_{2kN}$$

$$F_{2rad,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |F_{2rad,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |F_{2rad,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq F_{2radN}$$

$$F_{2ax,eq^*} \leq F_{2axN}$$

The following apply to the bearing service life L_{10h} ($ED_{10} \leq 40\%$):

$L_{10h} > 10000$ h with $1 < M_{2kN}/M_{2k^*} < 1.25$

$L_{10h} > 20000$ h with $1.25 < M_{2kN}/M_{2k^*} < 1.5$

$L_{10h} > 30000$ h with $1.5 < M_{2kN}/M_{2k^*}$

For different duty cycles:

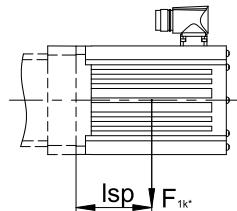

$$L_{10h} > L_{10h(ED_{10}=40\%)} \cdot \frac{40\%}{ED_{10}}$$

3.6.3 Permitted breakdown torques at the gear unit input

For a horizontal mounting position of the motor, verify that the permitted breakdown torque at the gear unit input is not exceeded before installation on a STOBER gear unit. You can find information for how to do that in this chapter.

Calculate the actual breakdown torque as follows:

$$M_{1k^*} = F_{1k^*} \cdot l_{sp} \leq M_{1k}$$

3.6.4 Recommendation for radial shaft seal rings

For a duty cycle > 60% and higher surrounding temperatures, we recommend radial shaft seal rings made of FKM at the output.

Properties:

- Excellent temperature resistance
- High chemical stability
- Very good resistance to aging
- Excellent resistance to mineral oils and greases
- For use in the food, beverage and pharmaceutical industries

Leak-proofness

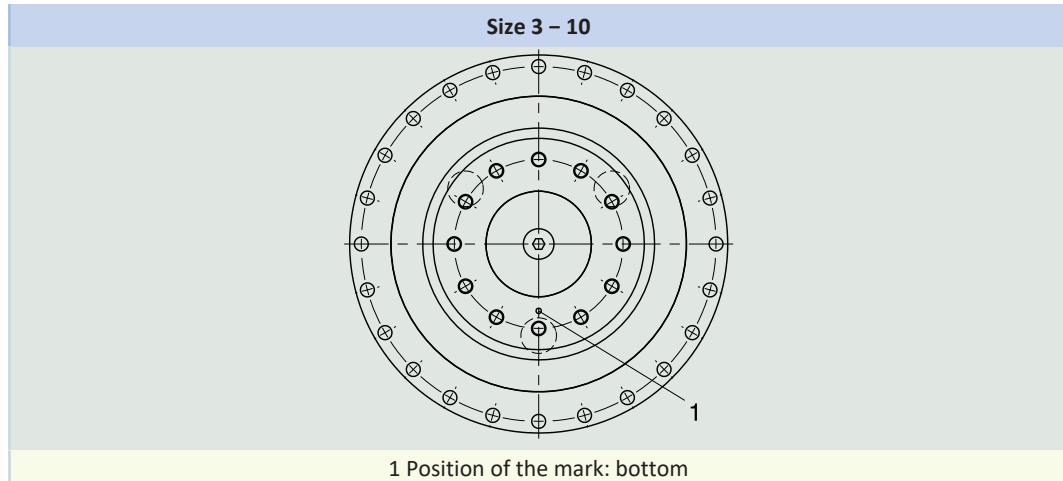

Our gear units are equipped with high-quality radial shaft seal rings and checked for leaks. However, a leak cannot be fully ruled out over the length of use of a gear unit. If you use a gear unit with goods incompatible with the lubricant, you must take measures to prevent direct contact with the gear unit lubricant in case of a leak.

3.6.5 Reverse operation

To ensure lubrication for circulating gearing parts during cyclic reverse operation from $\pm 20^\circ$ to $\pm 90^\circ$ at the output, pay careful attention to the position of the output shaft for the horizontal mounting of the gear unit, as shown in the diagrams below.

The images show the center position of reverse operation.

Cyclic reverse operation $\leq \pm 20^\circ$ on request.

Please note that the hole pattern may be different, depending on the size of the planetary gear unit.

4.3 Dimensional drawings

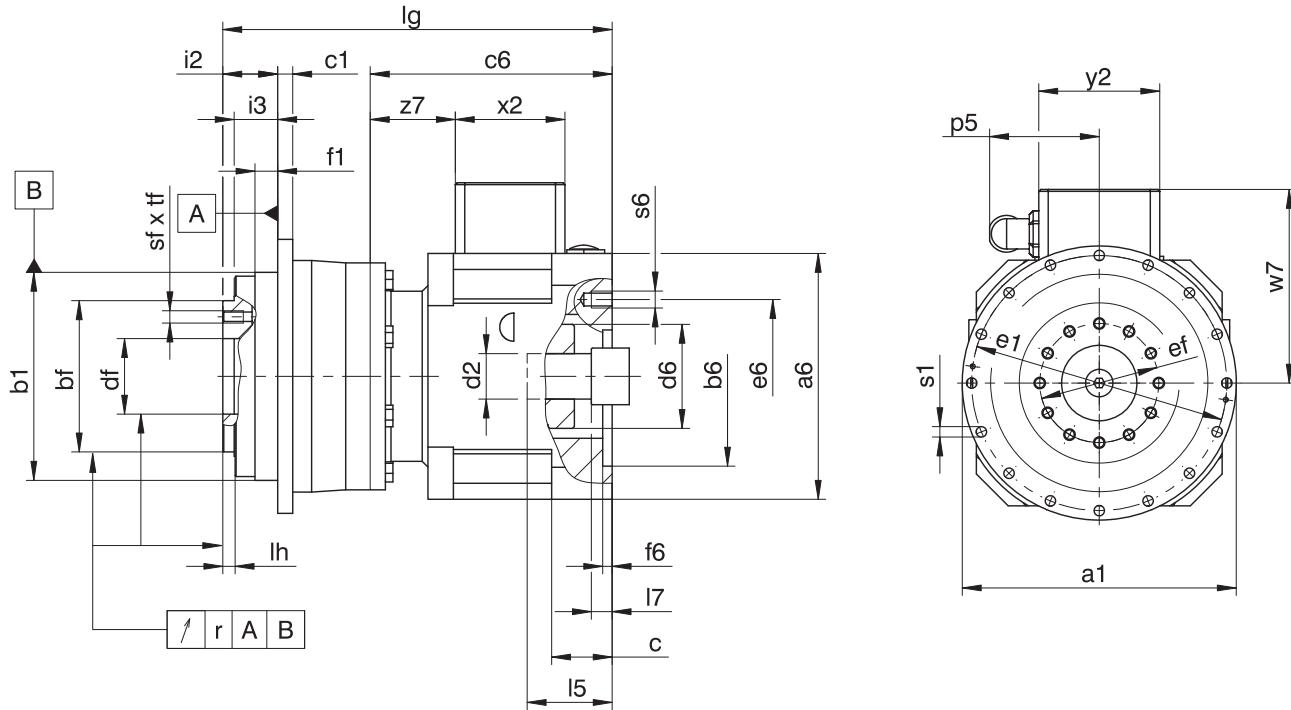

In this chapter, you can find the dimensions of the gear units as well as example dimensions of the mountable motor adapters.

Dimensions can exceed the specifications of ISO 2768-mK due to casting tolerances or accumulation of individual tolerances.

We reserve the right to make dimensional changes due to ongoing technical development.

You can download 3D models of our standard drives at <http://configurator.stoeber.de>.

Fig. 1: Motor adapter with ServoStop brake

4.5.2.2 Brake

A failsafe brake is integrated into the motor adapter. It has the function of a holding brake. Braking from full speed, e.g. in case of a voltage drop or an emergency off in hazard situations, is still possible.

The brake can be used as a single brake or together with the motor brake as a redundant brake system.

Function

The brakes installed in the motor adapter are electrically actuated spring-loaded brakes for dry running. In the de-energized state, braking takes place using spring force. The brake is released by an electromagnetic DC coil before the motor is switched on. The switch-on time t_{2B} (release time) is the time until the anchor plate releases from the axially moving brake disc and is magnetically held to the coil body. In this state, the brake is released and the coupling hub can rotate. In order to switch off (motor and brake), the residual magnetic flux of the iron parts (anchor and coil body) must be reduced; the associated time t_{1B} until the start of torque generation is defined as a response delay when linking. The link time t_{1B} is the time until the braking torque has built up to the nominal braking torque.

Manual release

Optionally, the brake can be equipped with a manual release.

Pressing the manual release deactivates the electronic actuation of the brake. Before pressing the manual release, you must establish the safety of the machine (e.g. protection against falling).

4.5.2.3 Electrical connection

- Terminal box (standard)
- Plug connector (optional, not possible in combination with release monitoring)

4.5.2.4 Monitoring

For monitoring the brake system, there are generally two options:

- Manual monitoring of wear via air gap checks with a feeler gauge
- Electrical release monitoring in the terminal box with a non-contact and wear-free proximity switch

4.5.3 Installation conditions

The torque and force values listed in this catalog are valid under the following conditions:

- When the flange shaft and gear housing are fastened on the machine side using screws of strength class 12.9
- When the gear housings are adjusted at pilot $\phi b1$, and also at pilot ϕb for sizes PHQ11 and PHQ12. The machine-side fit must be H7.

4.5.4 Mounting positions

The following table shows the standard mounting positions. Please indicate the mounting position when ordering 3-stage gear units.

4.5.5 Lubricants

STOBER fills the gear units with the amount and type of lubricant specified on the nameplate. The filling volume and the structure of the gear units depend on the mounting position.

Only install the gear units in the intended mounting position! Reposition the gear units only after consulting STOBER. Otherwise, STOBER assumes no liability for the gear units.

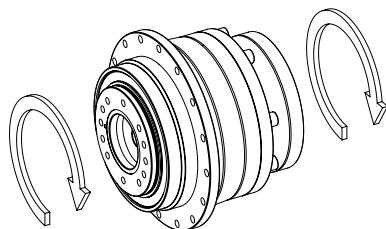

You will receive lubricants for use in the food industry upon request.

4.6 Project configuration

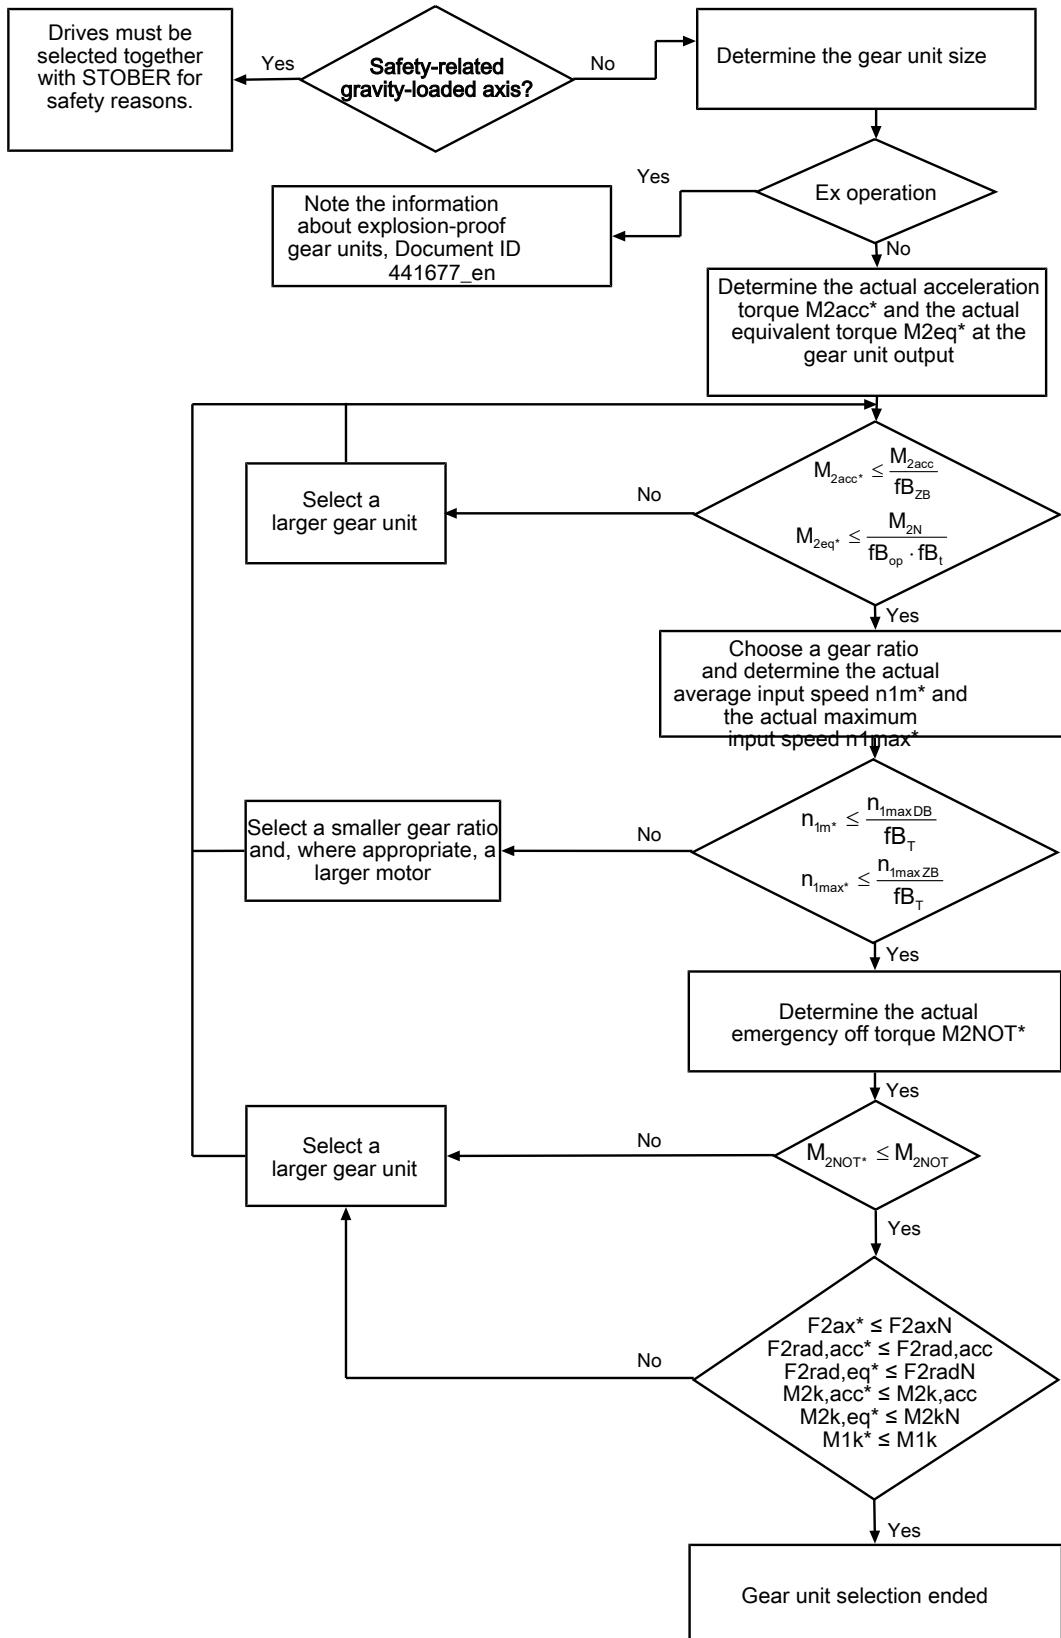

Project your drives using our SERVOsoft designing software. Download SERVOsoft for free at <https://www.stoeber.de/en/ServoSoft>.

Observe the limit conditions in this chapter to ensure a safe design for your drives.

An explanation of the formula symbols can be found in the chapter Formula symbols.

4.6.1 Drive selection

The formula symbols for values actually present in the application are marked with *.

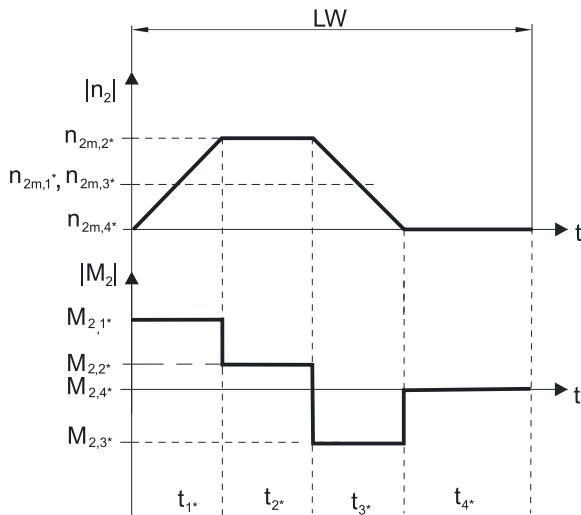

Calculate the forces and tilting torques in the chapter Permitted shaft loads.

Refer to the selection tables for the values for i , $n_{1\text{maxDB}}$, $n_{1\text{maxZB}}$, $M_{2\text{acc}}$ ($M_{2\text{accHT}}$ for reduced backlash), $M_{2\text{NOT}}$ and M_{2N} .

The values for fB_T , fB_{op} , fB_t and fB_{ZB} can be found in the corresponding tables in this chapter.

Example of cyclic operation

The following calculations are based on a representation of the power taken from the output based in accordance with the following example:

Calculation of the actual maximum acceleration torque

$$M_{2acc^*} = J_{tot} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual average input speed

$$n_{1m^*} = n_{2m^*} \cdot i$$

$$n_{2m^*} = \frac{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}{t_{1^*} + \dots + t_{n^*}}$$

If $t_{1^*} + \dots + t_{3^*} \geq 6$ min, calculate n_{2m^*} without the rest phase t_{4^*} .

The values for the ratio i can be found in the selection tables.

Calculation of the actual emergency-off torque

$$M_{2NOT^*} = J_{tot} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual equivalent torque

$$M_{2eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}}$$

The values specified in the tables apply to the permitted shaft loads:

- For shaft dimensions in accordance with the catalog
- For output speeds $n_{2m^*} \leq 100$ rpm ($F_{2axN} = F_{2ax100}$; $F_{2radN} = F_{2rad100}$; $M_{2kN} = M_{2k100}$)
- Only if radial forces on the gear unit are stabilized by its pilots (housing, flange shaft)

For other output speeds, download diagrams at <http://configurator.stoeber.de>.

The following applies to output speeds $n_{2m^*} > 100$ rpm:

$$F_{2axN} = \frac{F_{2ax100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$F_{2radN} = \frac{F_{2rad100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

The values for F_{2ax100} , $F_{2rad100}$ and M_{2k100} can be found in the table "Permitted shaft loads" in this chapter.

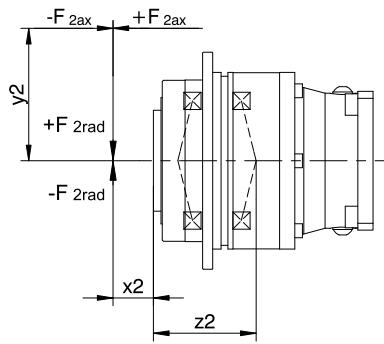

Fig. 2: Force application points

You can determine the permitted radial forces from the permitted breakdown torque M_{2kN} and $M_{2k,acc}$. The actual radial forces may not exceed the permitted radial forces. The permitted radial forces pertain to the shaft end ($x_2 = 0$).

$$M_{2k,acc^*} = \frac{2 \cdot F_{2ax^*} \cdot y_2 + F_{2rad,acc^*} \cdot (x_2 + z_2)}{1000} \leq M_{2k,acc}$$

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for F_{2ax100} , $F_{2rad100}$ and M_{2k100} by a factor of two.

Also note the calculation for equivalent values:

$$M_{2k,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2k,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2k,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq M_{2kN}$$

$$F_{2rad,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |F_{2rad,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |F_{2rad,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq F_{2radN}$$

$$F_{2ax,eq^*} \leq F_{2axN}$$

The following apply to the bearing service life L_{10h} ($ED_{10} \leq 40\%$):

$$L_{10h} > 10000 \text{ h with } 1 < M_{2kN}/M_{2k^*} < 1.25$$

$$L_{10h} > 20000 \text{ h with } 1.25 < M_{2kN}/M_{2k^*} < 1.5$$

$$L_{10h} > 30000 \text{ h with } 1.5 < M_{2kN}/M_{2k^*}$$

For different duty cycles:

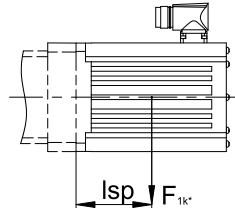

$$L_{10h} > L_{10h(ED_{10}=40\%)} \cdot \frac{40\%}{ED_{10}}$$

4.6.3 Permitted breakdown torques at the gear unit input

For a horizontal mounting position of the motor, verify that the permitted breakdown torque at the gear unit input is not exceeded before installation on a STOBER gear unit. You can find information for how to do that in this chapter.

Calculate the actual breakdown torque as follows:

$$M_{1k^*} = F_{1k^*} \cdot l_{sp} \leq M_{1k}$$

Type	M_{1k} [Nm]
MB23	45
MB33	90
MB43	200
MB53	450

4.6.4 Recommendation for radial shaft seal rings

For a duty cycle > 60% and higher surrounding temperatures, we recommend radial shaft seal rings made of FKM at the output.

Properties:

- Excellent temperature resistance
- High chemical stability
- Very good resistance to aging
- Excellent resistance to mineral oils and greases
- For use in the food, beverage and pharmaceutical industries

Leak-proofness

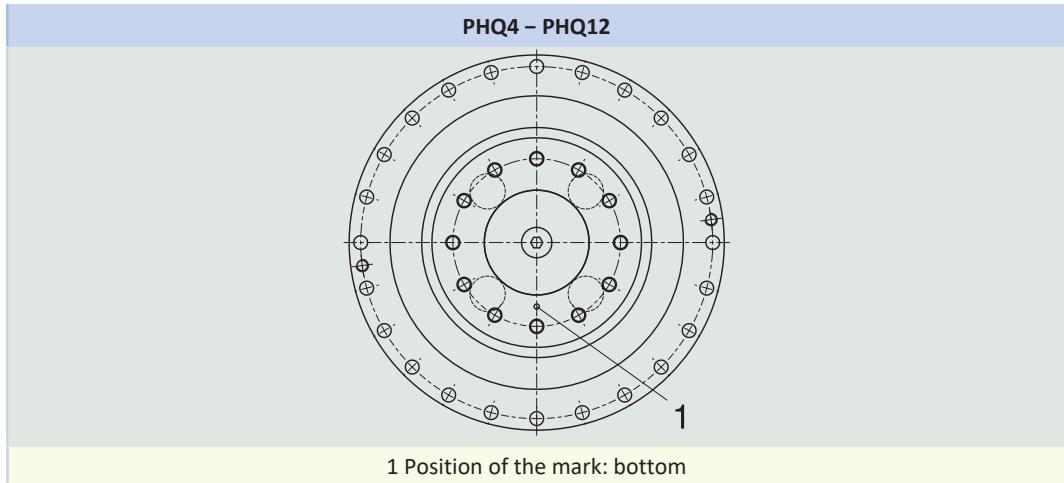

Our gear units are equipped with high-quality radial shaft seal rings and checked for leaks. However, a leak cannot be fully ruled out over the length of use of a gear unit. If you use a gear unit with goods incompatible with the lubricant, you must take measures to prevent direct contact with the gear unit lubricant in case of a leak.

4.6.5 Reverse operation

To ensure lubrication for circulating gearing parts during cyclic reverse operation from $\pm 20^\circ$ to $\pm 90^\circ$ at the output, pay careful attention to the position of the output shaft for the horizontal mounting of the gear unit, as shown in the diagrams below.

The images show the center position of reverse operation.

Cyclic reverse operation $\leq \pm 20^\circ$ on request.

Please note that the hole pattern may be different, depending on the size of the planetary gear unit.

5.3 Dimensional drawings

In this chapter, you can find the dimensions of the gear units as well as example dimensions of the mountable motor adapters.

Dimensions can exceed the specifications of ISO 2768-mK due to casting tolerances or accumulation of individual tolerances.

We reserve the right to make dimensional changes due to ongoing technical development.

You can download 3D models of our standard drives at <http://configurator.stoeber.de>.

Fig. 1: Motor adapter with ServoStop brake

5.5.2.2 Brake

A failsafe brake is integrated into the motor adapter. It has the function of a holding brake. Braking from full speed, e.g. in case of a voltage drop or an emergency off in hazard situations, is still possible.

The brake can be used as a single brake or together with the motor brake as a redundant brake system.

Function

The brakes installed in the motor adapter are electrically actuated spring-loaded brakes for dry running. In the de-energized state, braking takes place using spring force. The brake is released by an electromagnetic DC coil before the motor is switched on. The switch-on time t_{2B} (release time) is the time until the anchor plate releases from the axially moving brake disc and is magnetically held to the coil body. In this state, the brake is released and the coupling hub can rotate. In order to switch off (motor and brake), the residual magnetic flux of the iron parts (anchor and coil body) must be reduced; the associated time t_{1B} until the start of torque generation is defined as a response delay when linking. The link time t_{1B} is the time until the braking torque has built up to the nominal braking torque.

Manual release

Optionally, the brake can be equipped with a manual release.

Pressing the manual release deactivates the electronic actuation of the brake. Before pressing the manual release, you must establish the safety of the machine (e.g. protection against falling).

5.5.2.3 Electrical connection

- Terminal box (standard)
- Plug connector (optional, not possible in combination with release monitoring)

5.5.2.4 Monitoring

For monitoring the brake system, there are generally two options:

- Manual monitoring of wear via air gap checks with a feeler gauge
- Electrical release monitoring in the terminal box with a non-contact and wear-free proximity switch

5.5.4 Shaft design

Gear units in sizes C0 – C9 come standard with a solid shaft with feather key.

Gear units in sizes C0 – C5 can be ordered with the option of a solid shaft without feather key. Only upon request starting at size C6.

5.5.5 Installation conditions

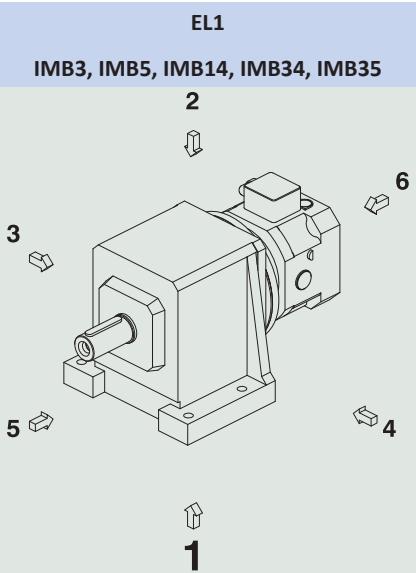

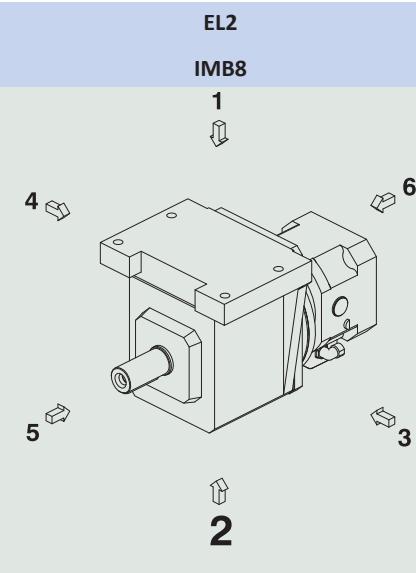

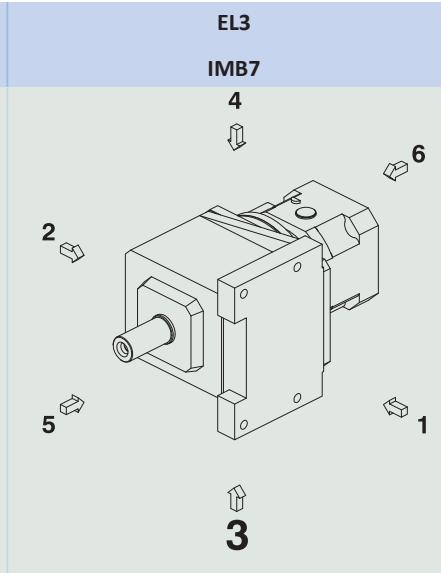

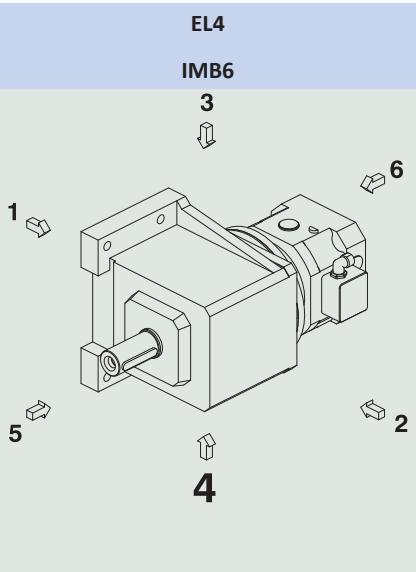

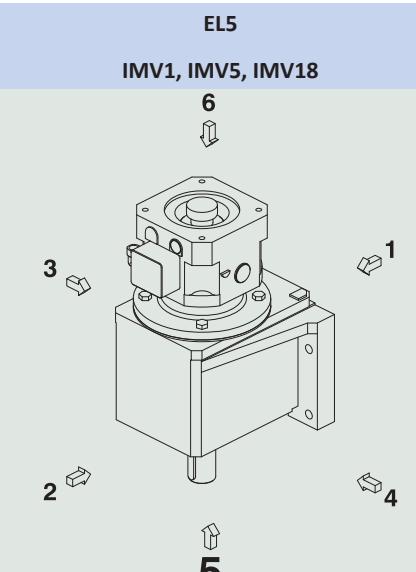

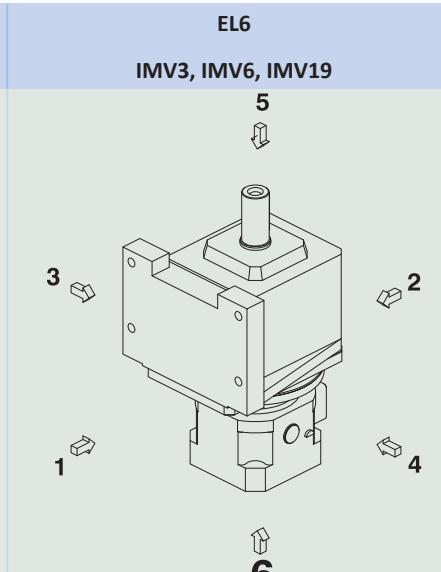

Fastening the gear units on the machine side using the pitch circle diameter

The specified torques and forces only apply when gear units are fastened on the machine side using screws of strength class 10.9. In addition, the gear housings must be adjusted at the pilot. The machine-side fit must be H7.

5.5.6 Mounting positions

The following table shows the standard mounting positions.

The numbers identify the gear unit sides. The mounting position is defined by the gear side facing downwards.

EL1 IMB3, IMB5, IMB14, IMB34, IMB35	EL2 IMB8	EL3 IMB7
		
EL4 IMB6	EL5 IMV1, IMV5, IMV18	EL6 IMV3, IMV6, IMV19
		

Since the lubricant filling volume of the gear unit depends on the mounting position, the mounting position must be specified when ordering.

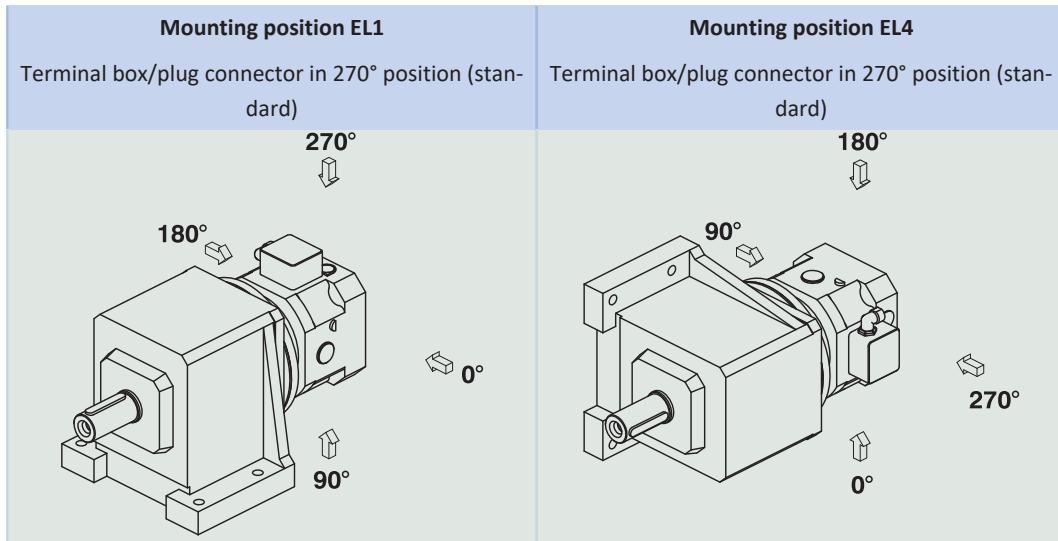

5.5.7 Lubricants

STOBER fills the gear units with the amount and type of lubricant specified on the nameplate. The filling volume and the structure of the gear units depend on the mounting position.

Only install the gear units in the intended mounting position! Reposition the gear units only after consulting STOBER. Otherwise, STOBER assumes no liability for the gear units.

You will receive lubricants for use in the food industry upon request.

5.5.8 Position of the terminal box/plug connector

Indicate variations for your gear unit in the purchase order.

Note that the terminal box/plug connector position rotates along with the gear unit if the geared motor is in another mounting position.

5.6.1 Drive selection

The formula symbols for values actually present in the application are marked with *.

Calculate the forces and tilting torques in the chapter Permitted shaft loads.

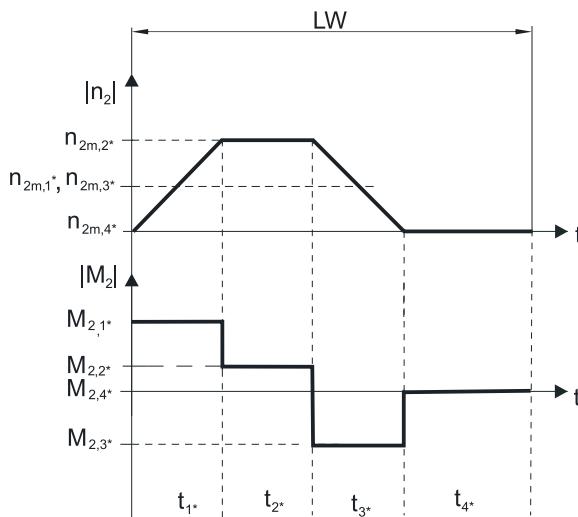

The values for i , $n_{1\text{maxDB}}$, $n_{1\text{maxZB}}$, $M_{1\text{Bstat}}$, $M_{2\text{acc}}$, $M_{2\text{NOT}}$ and M_{2N} can be found in selection tables.

The values for the available maximum motor brake torque $M_{M,B\text{max}*}$ can be found in the manufacturer catalog.

The values for fB_t , fB_{op} and fB_t can be found in the corresponding tables in this chapter.

Example of cyclic operation

The following calculations are based on a representation of the power taken from the output based in accordance with the following example:

Calculation of the actual maximum acceleration torque

$$M_{2\text{acc}^*} = J_{\text{tot}} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual average input speed

$$n_{1m^*} = n_{2m^*} \cdot i$$

$$n_{2m^*} = \frac{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}{t_{1^*} + \dots + t_{n^*}}$$

If $t_{1^*} + \dots + t_{3^*} \geq 6 \text{ min}$, calculate n_{2m^*} without the rest phase t_{4^*} .

The values for the ratio i can be found in the selection tables.

Calculation of the actual emergency-off torque

$$M_{2\text{NOT}^*} = J_{\text{tot}} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual equivalent torque

$$M_{2\text{eq}^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}}$$

Motor with convection cooling	$\leq 20^\circ\text{C}$	1.0
	$\leq 30^\circ\text{C}$	1.1
	$\leq 40^\circ\text{C}$	1.25

Notes

- The maximum permitted gear unit temperature of $\leq 80^\circ\text{C}$ must not be exceeded. Doing so may result in damage to the gear unit.

5.6.2 Permitted shaft loads for the output shaft

The values specified in the tables apply to the permitted shaft loads:

- For shaft dimensions in accordance with the catalog
- For output speeds $n_{2m^*} \leq 20 \text{ rpm}$ ($F_{2axN} = F_{2ax20}$; $F_{2radN} = F_{2rad20}$; $M_{2kN} = M_{2k20}$)
- Only if radial forces on the gear unit are stabilized by its pilots for the pitch circle diameter and flange housing design

For other output speeds, download diagrams at <http://configurator.stoeber.de>.

The following applies to output speeds $n_{2m^*} > 20 \text{ rpm}$:

$$F_{2axN} = \frac{F_{2ax20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

$$F_{2radN} = \frac{F_{2rad20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

The values for F_{2ax20} , F_{2rad20} and M_{2k20} can be found in the table "Permitted shaft loads" in this chapter.

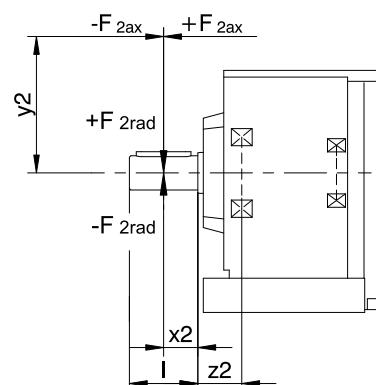

Fig. 2: Force application points

The specified values for F_{2rad20} are based on application of force at the middle of the output shaft: $x_2 = l/2$.

Shaft dimensions can be found in the "Dimensional drawings" chapter.

The following applies to other force application points:

$$M_{2k*} = \frac{2 \cdot F_{2ax*} \cdot y_2 + F_{2rad*} \cdot (x_2 + z_2)}{1000} \leq M_{2kN}$$

$$F_{2rad*} \leq F_{2radN}$$

$$F_{2ax*} \leq F_{2axN}$$

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

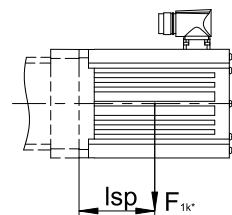

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for F_{2ax20} , F_{2rad20} and M_{2k20} by a factor of two.

5.6.3 Permitted breakdown torques at the gear unit input

For a horizontal mounting position of the motor, verify that the permitted breakdown torque at the gear unit input is not exceeded before installation on a STOBER gear unit. You can find information for how to do that in this chapter.

Calculate the actual breakdown torque as follows:

$$M_{1k*} = F_{1k*} \cdot l_{sp} \leq M_{1k}$$

Type	M_{1k} [Nm]
MB23	45
MB33	90
MB43	200
MB53	450

5.6.4 Radial shaft seal rings

Leak-proofness

Our gear units are equipped with high-quality radial shaft seal rings and checked for leaks. However, a leak cannot be fully ruled out over the length of use of a gear unit. If you use a gear unit with goods incompatible with the lubricant, you must take measures to prevent direct contact with the gear unit lubricant in case of a leak.

5.6.5 Oil expansion tank

The gear units have a higher fill level in mounting position EL5. The oil expansion tank prevents oil from escaping out of the gear unit.

Notes

- We recommend using an oil expansion tank in mounting position EL5 (additional cost) for fast running gear units with an input speed $n_1 > 1750$ rpm and gear ratios $i < 20$.
- The oil expansion tank can only be used with certain sizes; see the chapter Oil expansion tank

6.3 Dimensional drawings

In this chapter, you can find the dimensions of the gear units as well as example dimensions of the mountable motor adapters.

Dimensions can exceed the specifications of ISO 2768-mK due to casting tolerances or accumulation of individual tolerances.

We reserve the right to make dimensional changes due to ongoing technical development.

You can download 3D models of our standard drives at <http://configurator.stoeber.de>.

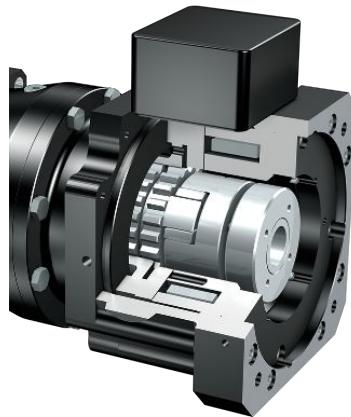

Fig. 1: Motor adapter with ServoStop brake

6.5.2.2 Brake

A failsafe brake is integrated into the motor adapter. It has the function of a holding brake. Braking from full speed, e.g. in case of a voltage drop or an emergency off in hazard situations, is still possible.

The brake can be used as a single brake or together with the motor brake as a redundant brake system.

Function

The brakes installed in the motor adapter are electrically actuated spring-loaded brakes for dry running. In the de-energized state, braking takes place using spring force. The brake is released by an electromagnetic DC coil before the motor is switched on. The switch-on time t_{2B} (release time) is the time until the anchor plate releases from the axially moving brake disc and is magnetically held to the coil body. In this state, the brake is released and the coupling hub can rotate. In order to switch off (motor and brake), the residual magnetic flux of the iron parts (anchor and coil body) must be reduced; the associated time t_{1B} until the start of torque generation is defined as a response delay when linking. The link time t_{1B} is the time until the braking torque has built up to the nominal braking torque.

Manual release

Optionally, the brake can be equipped with a manual release.

Pressing the manual release deactivates the electronic actuation of the brake. Before pressing the manual release, you must establish the safety of the machine (e.g. protection against falling).

6.5.2.3 Electrical connection

- Terminal box (standard)
- Plug connector (optional, not possible in combination with release monitoring)

6.5.2.4 Monitoring

For monitoring the brake system, there are generally two options:

- Manual monitoring of wear via air gap checks with a feeler gauge
- Electrical release monitoring in the terminal box with a non-contact and wear-free proximity switch

6.5.5 Installation conditions

Hollow shaft

The hollow shaft hole tolerance is ISO H7. The tolerance of the machine shaft must be ISO k6.

Take care to align the machine shaft with the gear unit hollow shaft when attaching the gear unit.

Maximum deviation ≤ 0.03 mm.

For simpler assembly and disassembly of the machine shaft, the hollow shafts are equipped with a spiral groove (as a grease deposit).

A hardened, threaded keeper plate is included in the scope of delivery. You also have the option to order the hollow shaft without a keeper plate.

Hollow shaft with shrink ring

The tolerance of the hollow shaft hole is ISO H7.

The machine shaft must be ISO h9.

Select a material for the machine shaft with a permitted surface pressure of $p \geq 325$ N/mm².

Possible materials:

- C45E +QT
- 42CrMo4

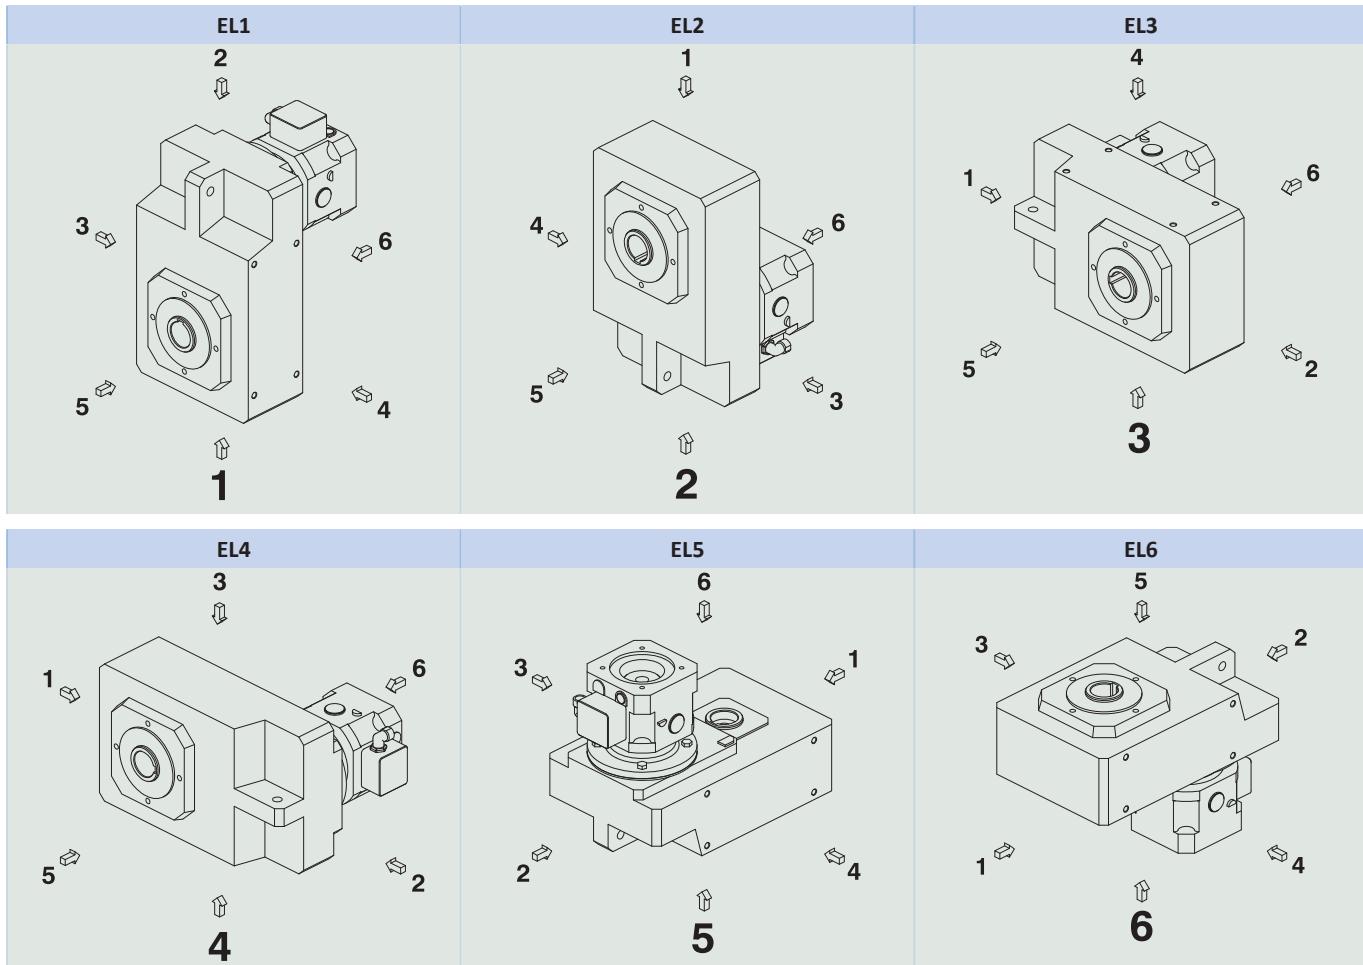

Fastening the gear units on the machine side using the pitch circle diameter

The specified torques and forces only apply when gear units are fastened on the machine side using screws of strength class 10.9. In addition, the gear housings must be adjusted at the pilot. The machine-side fit must be H7.

6.5.6 Mounting positions

The following table shows the standard mounting positions.

The numbers identify the gear unit sides. The mounting position is defined by the gear side facing downwards.

Since the lubricant filling volume of the gear unit depends on the mounting position, the mounting position must be specified when ordering.

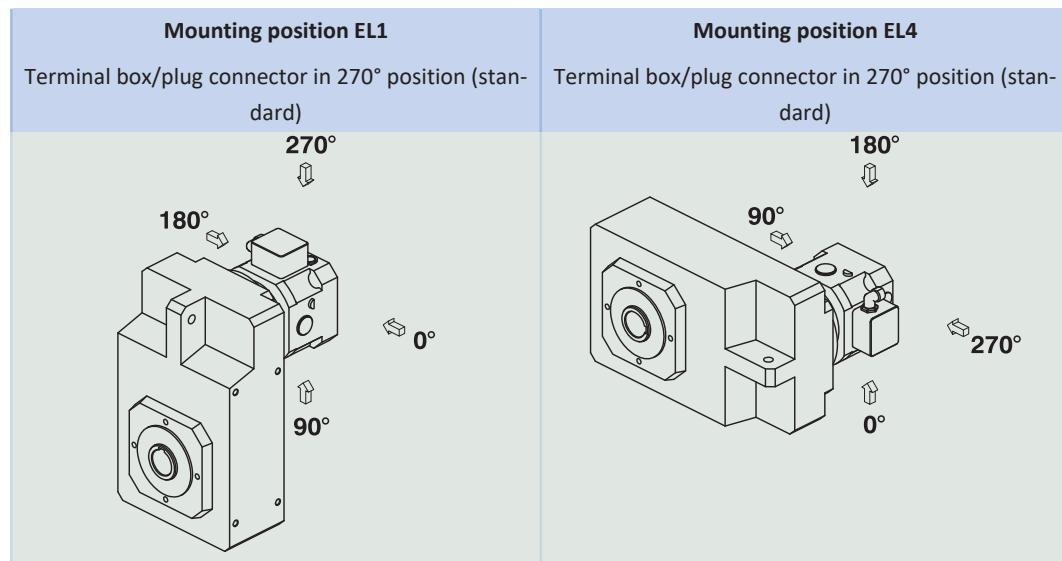

6.5.7 Lubricants

STOBER fills the gear units with the amount and type of lubricant specified on the nameplate. The filling volume and the structure of the gear units depend on the mounting position.

Only install the gear units in the intended mounting position! Reposition the gear units only after consulting STOBER. Otherwise, STOBER assumes no liability for the gear units.

You will receive lubricants for use in the food industry upon request.

6.5.8 Position of the terminal box/plug connector

Indicate variations for your gear unit in the purchase order.

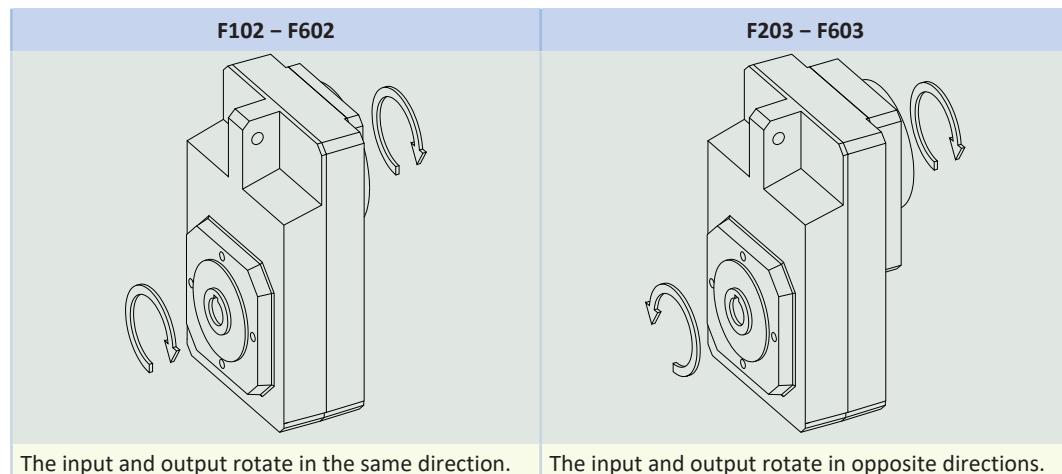

Note that the terminal box/plug connector position rotates along with the gear unit if the geared motor is in another mounting position.

6.6 Project configuration

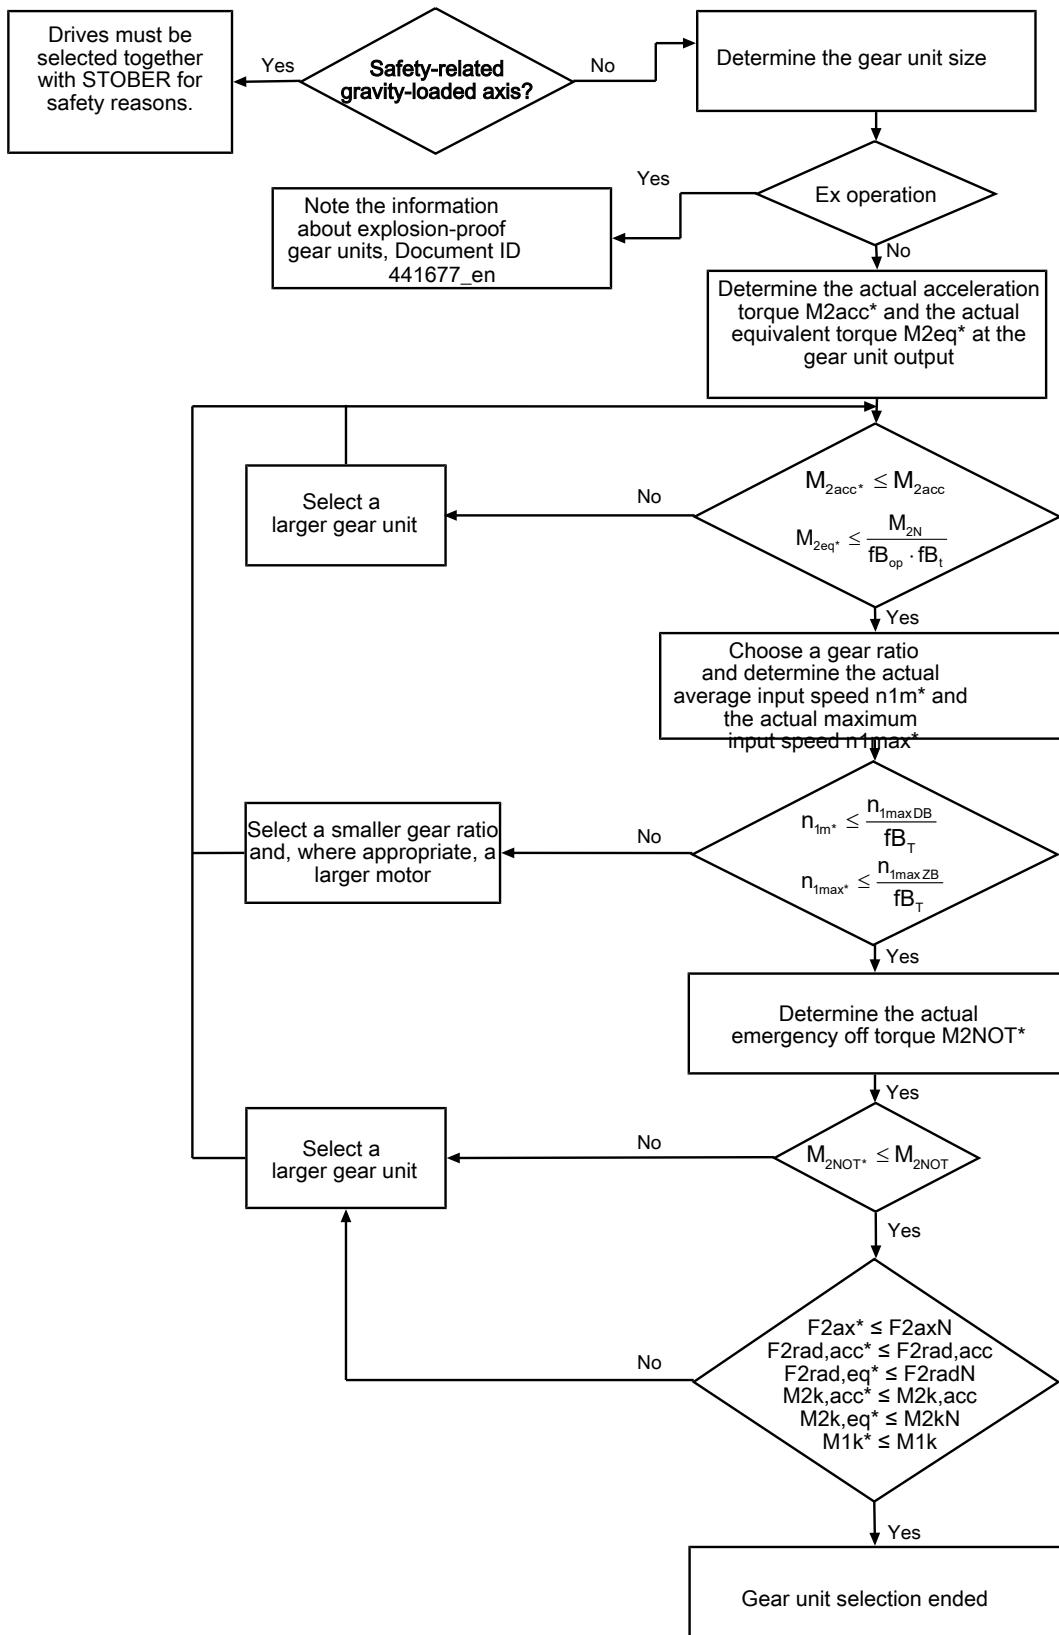

Project your drives using our SERVOSoft designing software. Download SERVOSoft for free at <https://www.stoeber.de/en/ServoSoft>.

Observe the limit conditions in this chapter to ensure a safe design for your drives.

An explanation of the formula symbols can be found in the chapter Formula symbols.

6.6.1 Drive selection

The formula symbols for values actually present in the application are marked with *.

Calculate the forces and tilting torques in the chapter Permitted shaft loads.

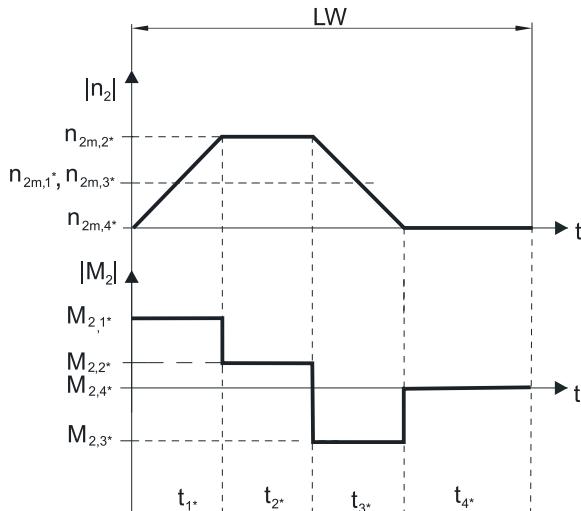

The values for i , $n_{1\max DB}$, $n_{1\max ZB}$, M_{1Bstat} , M_{2acc} , M_{2NOT} and M_{2N} can be found in selection tables.

The values for the available maximum motor brake torque $M_{M,Bmax*}$ can be found in the manufacturer catalog.

The values for fB_t , fB_{op} and fB_t can be found in the corresponding tables in this chapter.

Example of cyclic operation

The following calculations are based on a representation of the power taken from the output based in accordance with the following example:

Calculation of the actual maximum acceleration torque

$$M_{2acc*} = J_{tot} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_L*$$

Calculation of the actual average input speed

$$n_{1m*} = n_{2m*} \cdot i$$

$$n_{2m*} = \frac{|n_{2m,1*}| \cdot t_{1*} + \dots + |n_{2m,n*}| \cdot t_{n*}}{t_{1*} + \dots + t_{n*}}$$

If $t_{1*} + \dots + t_{3*} \geq 6$ min, calculate n_{2m*} without the rest phase t_{4*} .

The values for the ratio i can be found in the selection tables.

Calculation of the actual emergency-off torque

$$M_{2NOT*} = J_{tot} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_L*$$

Calculation of the actual equivalent torque

$$M_{2eq*} = \sqrt[3]{\frac{|n_{2m,1*}| \cdot t_{1*} \cdot |M_{2,1*}|^3 + \dots + |n_{2m,n*}| \cdot t_{n*} \cdot |M_{2,n*}|^3}{|n_{2m,1*}| \cdot t_{1*} + \dots + |n_{2m,n*}| \cdot t_{n*}}}$$

Notes

- The maximum permitted gear unit temperature of ≤ 80 °C must not be exceeded. Doing so may result in damage to the gear unit.

6.6.2 Permitted shaft loads for the output shaft

The values specified in the tables apply to the permitted shaft loads:

- For shaft dimensions in accordance with the catalog
- For output speeds $n_{2m^*} \leq 20$ rpm ($F_{2axN} = F_{2ax20}$; $F_{2radN} = F_{2rad20}$; $M_{2kN} = M_{2k20}$)
- Only if radial forces on the gear unit are stabilized by its pilots for the pitch circle diameter and flange housing design

6.6.2.1 V shaft design

Permitted shaft loads for V shaft design (solid shaft)

Type	z_2 [mm]	F_{2ax20} [N]	F_{2rad20} [N]	$F_{2rad,acc}$ [N]	M_{2k20} [Nm]	$M_{2k,acc}$ [Nm]

F6	44.0	3100	12500	12500	1200	1200

For other output speeds, download diagrams at <http://configurator.stoeber.de>.

The following applies to output speeds $n_{2m^*} > 20$ rpm:

$$F_{2axN} = \frac{F_{2ax20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

$$F_{2radN} = \frac{F_{2rad20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

The values for F_{2ax20} , F_{2rad20} and M_{2k20} can be found in the table "Permitted shaft loads" in this chapter.

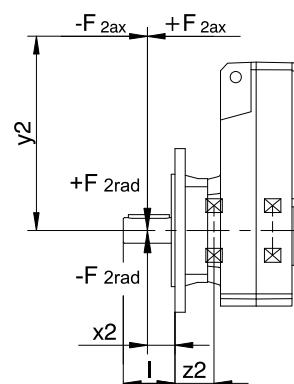

Fig. 2: Force application points for solid shaft

The specified values for F_{2rad20} are based on application of force at the middle of the output shaft: $x_2 = l/2$.

Shaft dimensions can be found in the "Dimensional drawings" chapter.

The following applies to other force application points:

$$M_{2k*} = \frac{2 \cdot F_{2ax*} \cdot y_2 + F_{2rad*} \cdot (x_2 + z_2)}{1000} \leq M_{2kN}$$

$$F_{2rad*} \leq F_{2radN}$$

$$F_{2ax*} \leq F_{2axN}$$

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for F_{2ax20} , F_{2rad20} and M_{2k20} by a factor of two.

For other output speeds, download diagrams at <http://configurator.stoeber.de>.

The following applies to output speeds $n_{2m*} > 20$ rpm:

$$F_{2axN} = \frac{F_{2ax20}}{\sqrt[3]{\frac{n_{2m*}}{20 \text{ rpm}}}}$$

$$F_{2radN} = \frac{F_{2rad20}}{\sqrt[3]{\frac{n_{2m*}}{20 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k20}}{\sqrt[3]{\frac{n_{2m*}}{20 \text{ rpm}}}}$$

The values for F_{2ax20} , F_{2rad20} and M_{2k20} can be found in the table "Permitted shaft loads" in this chapter.

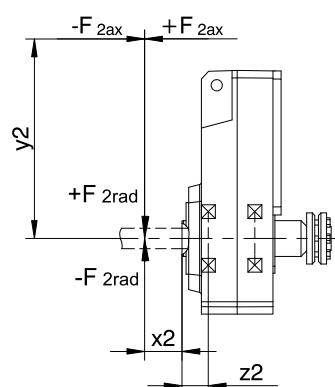

Fig. 3: Force application points for hollow shaft

You can determine the permitted radial forces from the permitted breakdown torque M_{2kN} . The actual radial forces may not exceed the permitted radial forces. The permitted radial forces pertain to the shaft end ($x2 = 0$).

$$M_{2k^*} = \frac{2 \cdot F_{2ax^*} \cdot y_2 + F_{2rad^*} \cdot (x_2 + z_2)}{1000} \leq M_{2kN}$$

$$F_{2ax^*} \leq F_{2axN}$$

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

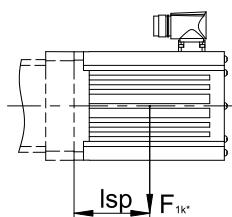

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for F_{2ax20} , F_{2rad20} and M_{2k20} by a factor of two.

6.6.3 Permitted breakdown torques at the gear unit input

For a horizontal mounting position of the motor, verify that the permitted breakdown torque at the gear unit input is not exceeded before installation on a STOBER gear unit. You can find information for how to do that in this chapter.

Calculate the actual breakdown torque as follows:

$$M_{1k^*} = F_{1k^*} \cdot l_{sp} \leq M_{1k}$$

Type	M_{1k} [Nm]

MB33	90
MB43	200
MB53	450

6.6.4 Radial shaft seal rings

Leak-proofness

Our gear units are equipped with high-quality radial shaft seal rings and checked for leaks. However, a leak cannot be fully ruled out over the length of use of a gear unit. If you use a gear unit with goods incompatible with the lubricant, you must take measures to prevent direct contact with the gear unit lubricant in case of a leak.

7.3 Dimensional drawings

In this chapter, you can find the dimensions of the gear units as well as example dimensions of the mountable motor adapters.

Dimensions can exceed the specifications of ISO 2768-mK due to casting tolerances or accumulation of individual tolerances.

We reserve the right to make dimensional changes due to ongoing technical development.

You can download 3D models of our standard drives at <http://configurator.stoeber.de>.

Fig. 1: Motor adapter with ServoStop brake

7.5.2.2 Brake

A failsafe brake is integrated into the motor adapter. It has the function of a holding brake. Braking from full speed, e.g. in case of a voltage drop or an emergency off in hazard situations, is still possible.

The brake can be used as a single brake or together with the motor brake as a redundant brake system.

Function

The brakes installed in the motor adapter are electrically actuated spring-loaded brakes for dry running. In the de-energized state, braking takes place using spring force. The brake is released by an electromagnetic DC coil before the motor is switched on. The switch-on time t_{2B} (release time) is the time until the anchor plate releases from the axially moving brake disc and is magnetically held to the coil body. In this state, the brake is released and the coupling hub can rotate. In order to switch off (motor and brake), the residual magnetic flux of the iron parts (anchor and coil body) must be reduced; the associated time t_{1B} until the start of torque generation is defined as a response delay when linking. The link time t_{1B} is the time until the braking torque has built up to the nominal braking torque.

Manual release

Optionally, the brake can be equipped with a manual release.

Pressing the manual release deactivates the electronic actuation of the brake. Before pressing the manual release, you must establish the safety of the machine (e.g. protection against falling).

7.5.2.3 Electrical connection

- Terminal box (standard)
- Plug connector (optional, not possible in combination with release monitoring)

7.5.2.4 Monitoring

For monitoring the brake system, there are generally two options:

- Manual monitoring of wear via air gap checks with a feeler gauge
- Electrical release monitoring in the terminal box with a non-contact and wear-free proximity switch

7.5.2.6 Brake switching times

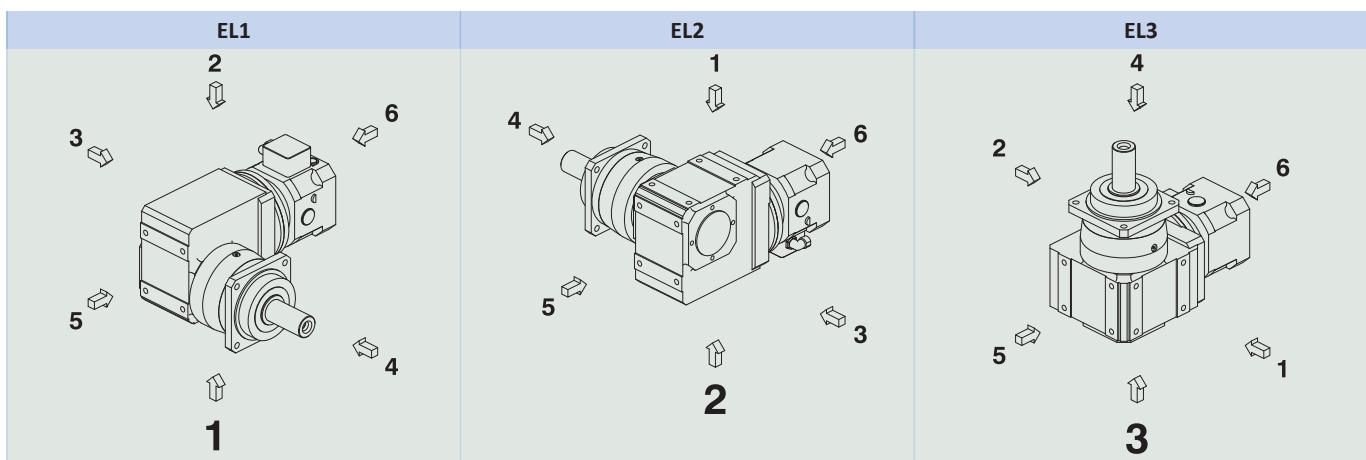

7.5.3 Installation conditions

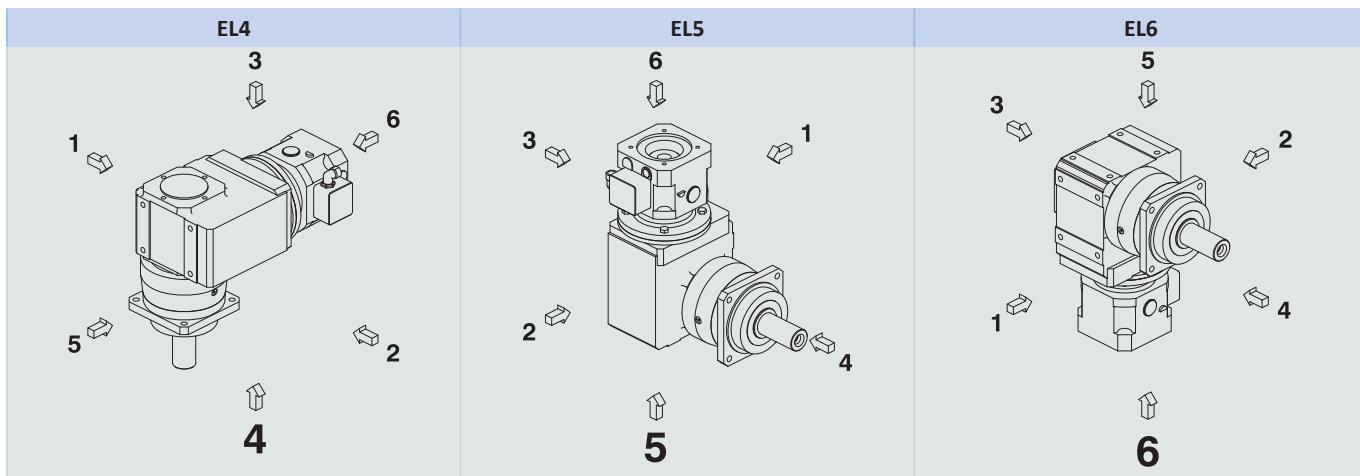

The specified torques and forces only apply when gear units are fastened on the machine side using screws of strength class 12.9. In addition, the gear housings must be adjusted at the pilot. The machine-side fit must be H7.

7.5.4 Mounting positions

The following table shows the standard mounting positions.

The numbers identify the gear unit sides. The mounting position is defined by the gear side facing downwards.

Since the lubricant filling volume of the gear unit depends on the mounting position, the mounting position must be specified when ordering.

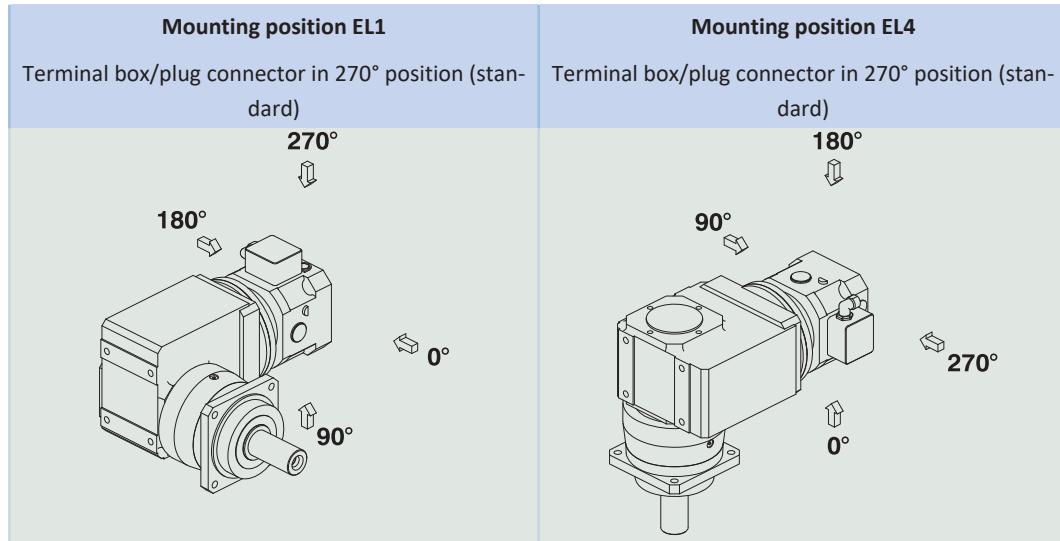

7.5.5 Lubricants

STOBER fills the gear units with the amount and type of lubricant specified on the nameplate. The filling volume and the structure of the gear units depend on the mounting position.

Only install the gear units in the intended mounting position! Reposition the gear units only after consulting STOBER. Otherwise, STOBER assumes no liability for the gear units.

You will receive lubricants for use in the food industry upon request.

7.5.6 Position of the terminal box/plug connector

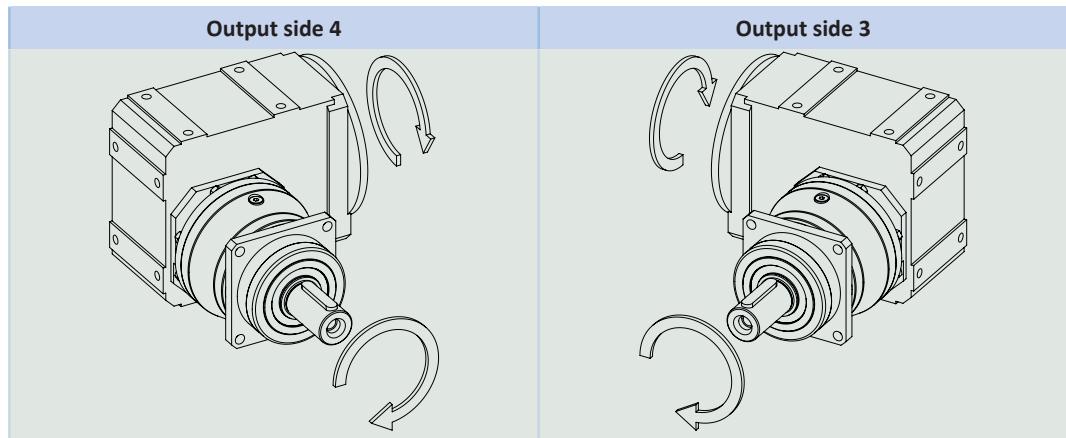

Indicate variations for your gear unit in the purchase order.

Note that the terminal box/plug connector position rotates along with the gear unit if the geared motor is in another mounting position.

7.6 Project configuration

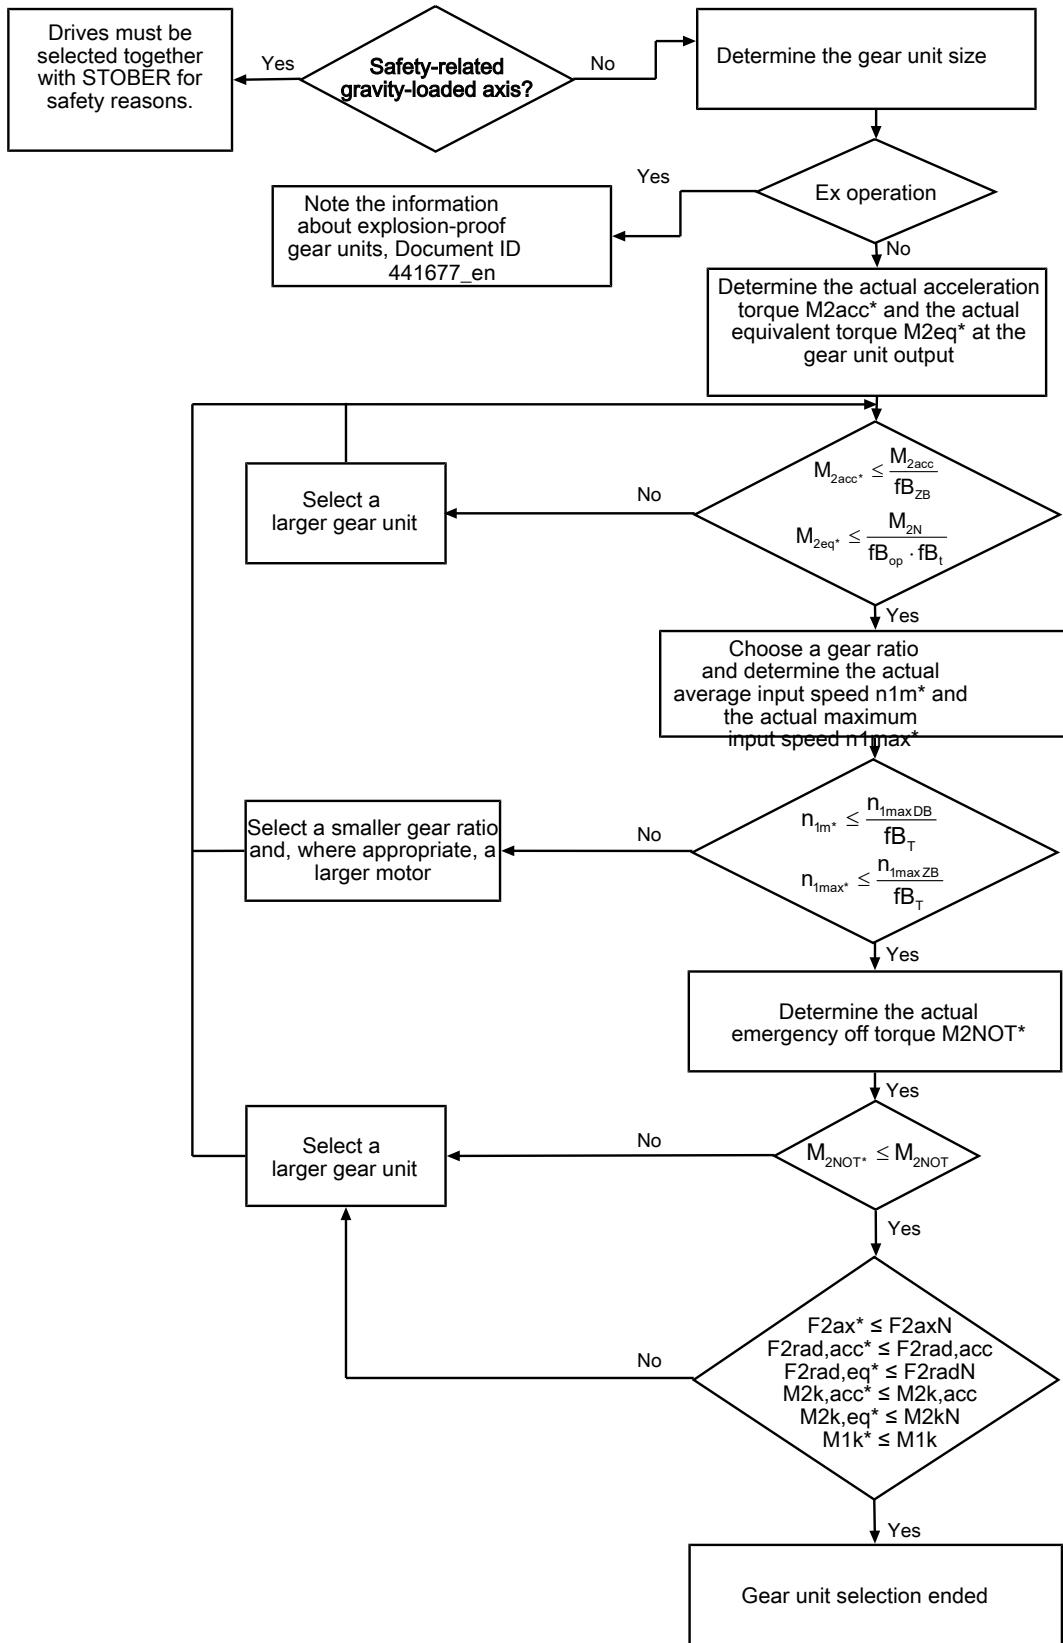

Project your drives using our SERVOsoft designing software. Download SERVOsoft for free at <https://www.stoeber.de/en/ServoSoft>.

Observe the limit conditions in this chapter to ensure a safe design for your drives.

An explanation of the formula symbols can be found in the chapter Formula symbols.

7.6.1 Drive selection

The formula symbols for values actually present in the application are marked with *.

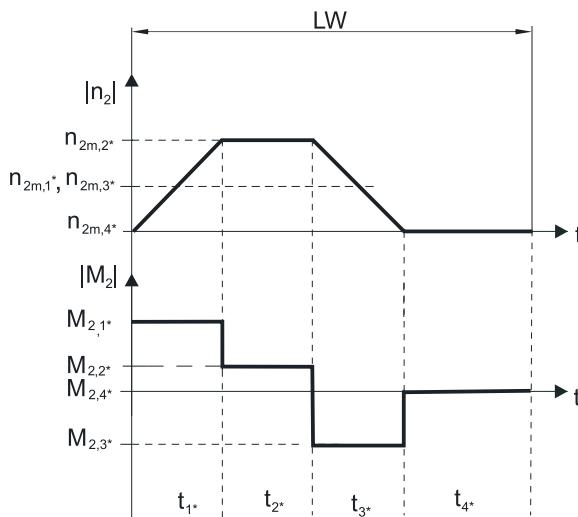

Calculate the forces and tilting torques in the chapter Permitted shaft loads.

Refer to the selection tables for the values for i , $n_{1\text{maxDB}}$, $n_{1\text{maxZB}}$, $M_{2\text{acc}}$ ($M_{2\text{accHT}}$ for reduced backlash), $M_{2\text{NOT}}$ and M_{2N} .

The values for fB_T , fB_{op} , fB_t and fB_{ZB} can be found in the corresponding tables in this chapter.

Example of cyclic operation

The following calculations are based on a representation of the power taken from the output based in accordance with the following example:

Calculation of the actual maximum acceleration torque

$$M_{2\text{acc}^*} = J_{\text{tot}} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual average input speed

$$n_{1m^*} = n_{2m^*} \cdot i$$

$$n_{2m^*} = \frac{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}{t_{1^*} + \dots + t_{n^*}}$$

If $t_{1^*} + \dots + t_{3^*} \geq 6 \text{ min}$, calculate n_{2m^*} without the rest phase t_{4^*} .

The values for the ratio i can be found in the selection tables.

Calculation of the actual emergency-off torque

$$M_{2\text{NOT}^*} = J_{\text{tot}} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual equivalent torque

$$M_{2\text{eq}^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}}$$

- Only if radial forces on the gear unit are stabilized by its pilots (housing, flange shaft)

For other output speeds, download diagrams at <http://configurator.stoeber.de>.

The following applies to output speeds $n_{2m^*} > 100$ rpm:

$$F_{2axN} = \frac{F_{2ax100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$F_{2radN} = \frac{F_{2rad100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

The values for F_{2ax100} , $F_{2rad100}$ and M_{2k100} can be found in the table "Permitted shaft loads" in this chapter.

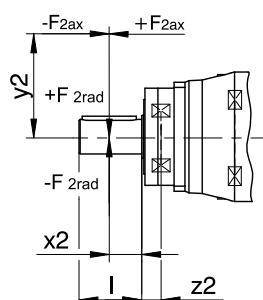

Fig. 5: Force application points

The specified values for $F_{2rad100}$ and $F_{2rad,acc}$ refer to an application of force at the center of the output shaft: $x_2 = l/2$.

Shaft dimensions can be found in the "Dimensional drawings" chapter.

The following applies to other force application points:

$$M_{2k,acc^*} = \frac{2 \cdot F_{2ax^*} \cdot y_2 + F_{2rad,acc^*} \cdot (x_2 + z_2)}{1000} \leq M_{2k,acc}$$

$$F_{2rad,acc^*} \leq F_{2rad,acc}$$

$$F_{2ax^*} \leq F_{2axN}$$

The values for $F_{2rad,acc}$ and $M_{2k,acc}$ can be found in the table "Permitted shaft loads" in this chapter.

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for F_{2ax100} , $F_{2rad100}$ and M_{2k100} by a factor of two.

Also note the calculation for equivalent values:

$$M_{2k,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2k,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2k,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq M_{2kN}$$

$$F_{2rad,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |F_{2rad,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |F_{2rad,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq F_{2radN}$$

The following apply to the bearing service life L_{10h} ($ED_{10} \leq 40\%$):

$L_{10h} > 10000$ h with $1 < M_{2kN}/M_{2k^*} < 1.25$

$L_{10h} > 20000$ h with $1.25 < M_{2kN}/M_{2k^*} < 1.5$

$L_{10h} > 30000$ h with $1.5 < M_{2kN}/M_{2k^*}$

For different duty cycles:

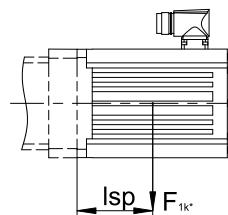

$$L_{10h} > L_{10h(ED_{10}=40\%)} \cdot \frac{40\%}{ED_{10}}$$

7.6.3 Permitted breakdown torques at the gear unit input

For a horizontal mounting position of the motor, verify that the permitted breakdown torque at the gear unit input is not exceeded before installation on a STOBER gear unit. You can find information for how to do that in this chapter.

Calculate the actual breakdown torque as follows:

$$M_{1k^*} = F_{1k^*} \cdot l_{sp} \leq M_{1k}$$

7.6.4 Recommendation for radial shaft seal rings

For a duty cycle > 60% and higher surrounding temperatures, we recommend radial shaft seal rings made of FKM at the output.

Properties:

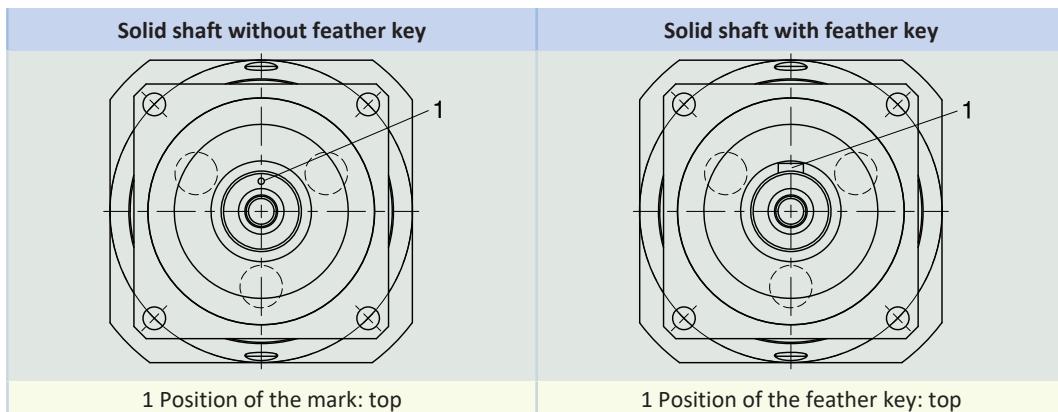

- Excellent temperature resistance
- High chemical stability
- Very good resistance to aging
- Excellent resistance to mineral oils and greases
- For use in the food, beverage and pharmaceutical industries

Leak-proofness

Our gear units are equipped with high-quality radial shaft seal rings and checked for leaks. However, a leak cannot be fully ruled out over the length of use of a gear unit. If you use a gear unit with goods incompatible with the lubricant, you must take measures to prevent direct contact with the gear unit lubricant in case of a leak.

7.6.5 Reverse operation

To ensure lubrication for circulating gearing parts during cyclic reverse operation from $\pm 20^\circ$ to $\pm 90^\circ$ at the output, pay careful attention to the position of the output shaft for the horizontal mounting of the gear unit, as shown in the diagrams below. The images show the center position of reverse operation. Cyclic reverse operation $\leq \pm 20^\circ$ on request.

Notes

- If you use the solid shaft without a feather key (G), you must note the position of the mark during assembly.
- As an alternative, you can use the solid shaft with a feather key (P). In that case, the feather key functions for position orientation. For a backlash-free connection, also use a clamp.

8.3 Dimensional drawings

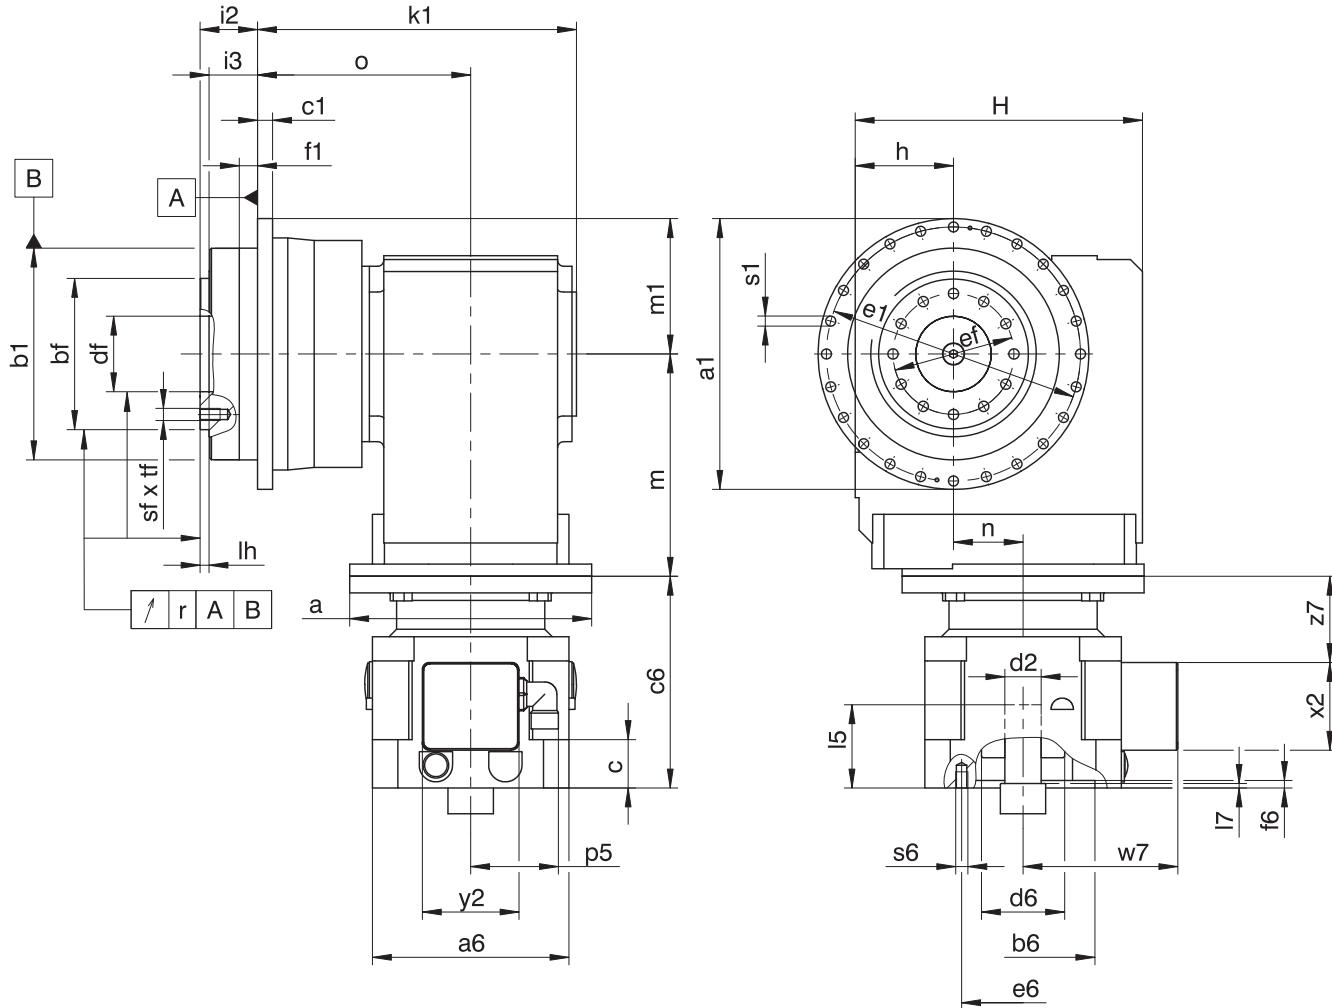

In this chapter, you can find the dimensions of the gear units as well as example dimensions of the mountable motor adapters.

Dimensions can exceed the specifications of ISO 2768-mK due to casting tolerances or accumulation of individual tolerances.

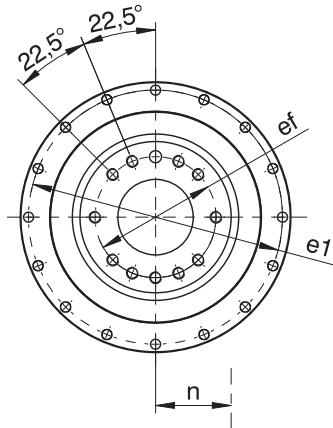

We reserve the right to make dimensional changes due to ongoing technical development.

You can download 3D models of our standard drives at <http://configurator.stoeber.de>.

In the table above, you will find example motor connection dimensions for the MB motor adapter. Note that when dimension c is lengthened (depending on the motor used), dimensions c6 and l5 are also lengthened accordingly.

You will find additional motor connection dimensions for the MB motor adapter in our STOBER Configurator at <http://configurator.stoeber.de>. Here, you can directly download a 3D model of your drive.

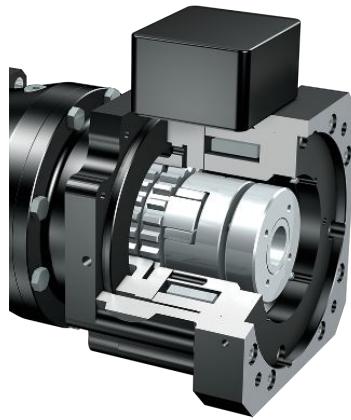

Fig. 1: Motor adapter with ServoStop brake

8.5.2.2 Brake

A failsafe brake is integrated into the motor adapter. It has the function of a holding brake. Braking from full speed, e.g. in case of a voltage drop or an emergency off in hazard situations, is still possible.

The brake can be used as a single brake or together with the motor brake as a redundant brake system.

Function

The brakes installed in the motor adapter are electrically actuated spring-loaded brakes for dry running. In the de-energized state, braking takes place using spring force. The brake is released by an electromagnetic DC coil before the motor is switched on. The switch-on time t_{2B} (release time) is the time until the anchor plate releases from the axially moving brake disc and is magnetically held to the coil body. In this state, the brake is released and the coupling hub can rotate. In order to switch off (motor and brake), the residual magnetic flux of the iron parts (anchor and coil body) must be reduced; the associated time t_{1B} until the start of torque generation is defined as a response delay when linking. The link time t_{1B} is the time until the braking torque has built up to the nominal braking torque.

Manual release

Optionally, the brake can be equipped with a manual release.

Pressing the manual release deactivates the electronic actuation of the brake. Before pressing the manual release, you must establish the safety of the machine (e.g. protection against falling).

8.5.2.3 Electrical connection

- Terminal box (standard)
- Plug connector (optional, not possible in combination with release monitoring)

8.5.2.4 Monitoring

For monitoring the brake system, there are generally two options:

- Manual monitoring of wear via air gap checks with a feeler gauge
- Electrical release monitoring in the terminal box with a non-contact and wear-free proximity switch

8.5.2.6 Brake switching times

8.5.3 Installation conditions

The torque and force values listed in this catalog are valid under the following conditions:

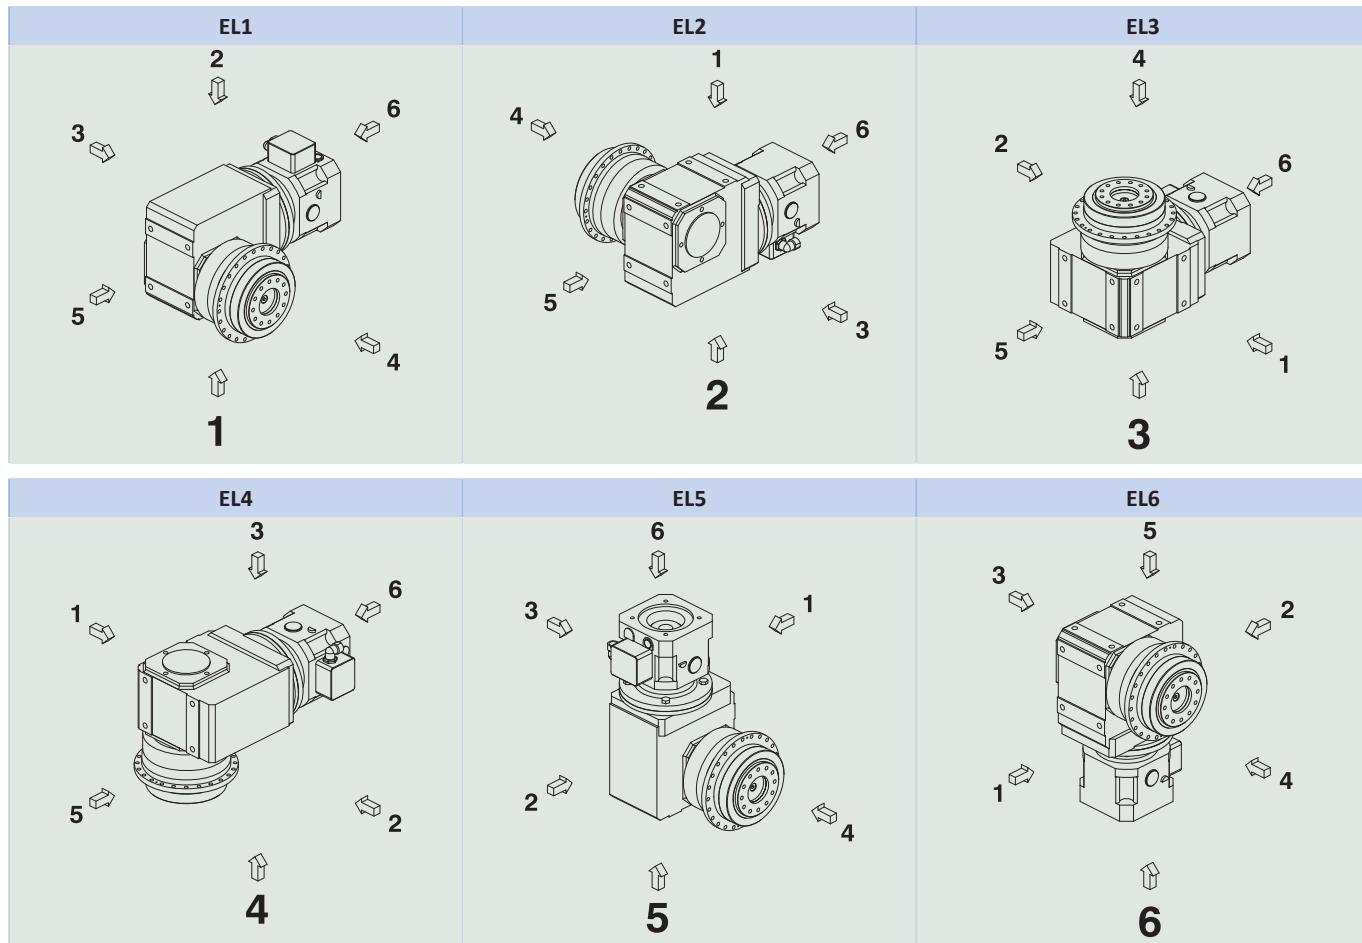

- When the flange shaft and gear housing are fastened on the machine side using screws of strength class 12.9
- When the gear housings are adjusted at pilot $\phi b1$. The machine-side fit must be H7.
- When the flange shaft is adjusted using the connecting element at pilot ϕbf or ϕdf

8.5.4 Mounting positions

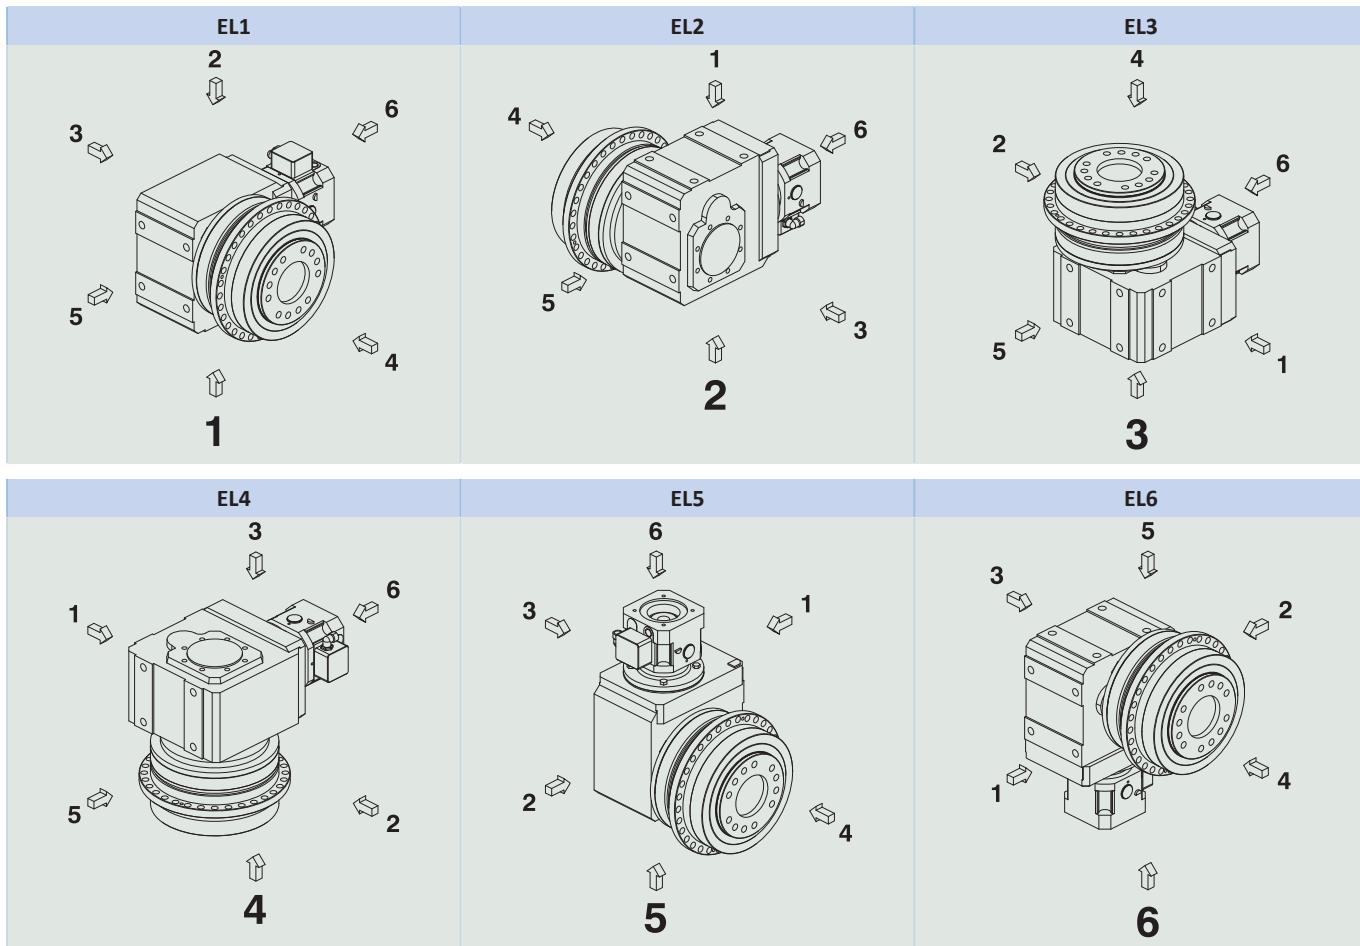

The following table shows the standard mounting positions.

The numbers identify the gear unit sides. The mounting position is defined by the gear side facing downwards.

PH5K1 – PH8K3

PH9K5 – PH10K6

Since the lubricant filling volume of the gear unit depends on the mounting position, the mounting position must be specified when ordering.

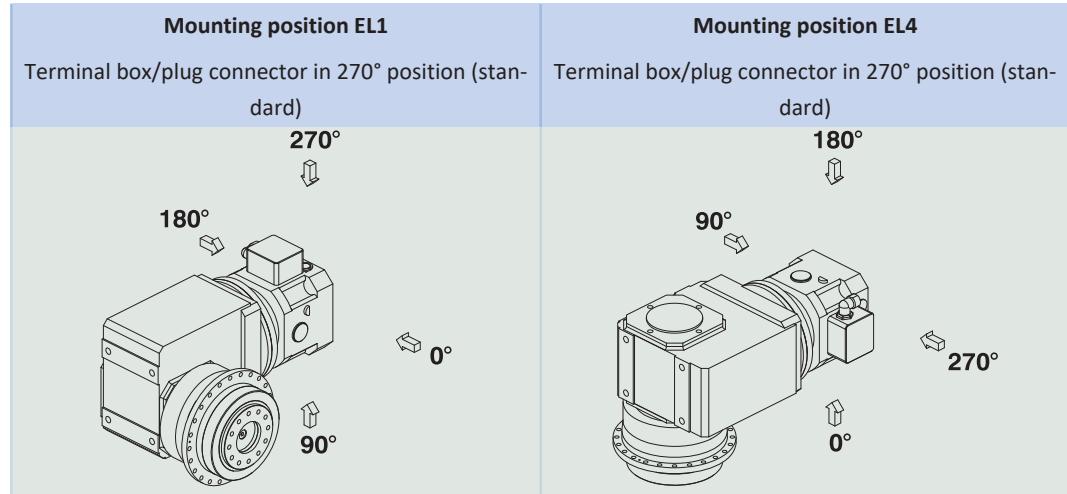

8.5.5 Lubricants

STOBER fills the gear units with the amount and type of lubricant specified on the nameplate. The filling volume and the structure of the gear units depend on the mounting position.

Only install the gear units in the intended mounting position! Reposition the gear units only after consulting STOBER. Otherwise, STOBER assumes no liability for the gear units.

You will receive lubricants for use in the food industry upon request.

8.5.6 Position of the terminal box/plug connector

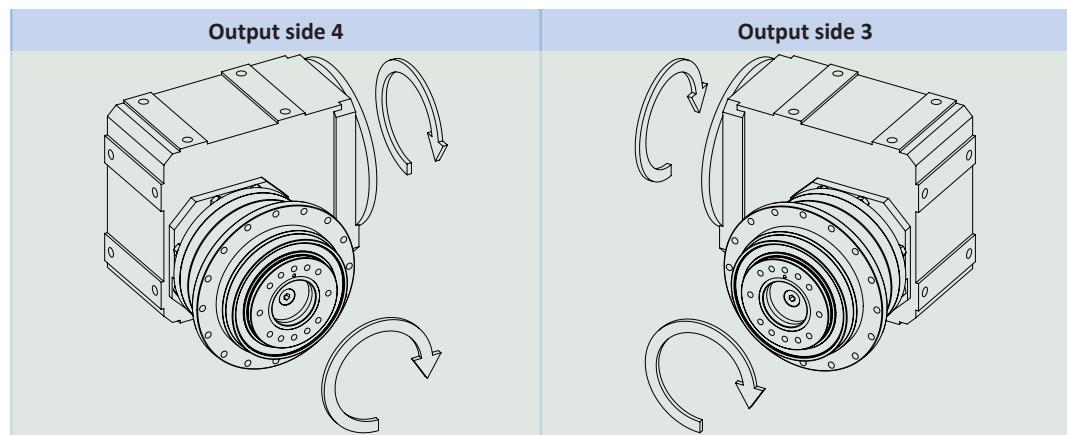

Indicate variations for your gear unit in the purchase order.

Note that the terminal box/plug connector position rotates along with the gear unit if the geared motor is in another mounting position.

8.6.1 Drive selection

The formula symbols for values actually present in the application are marked with *.

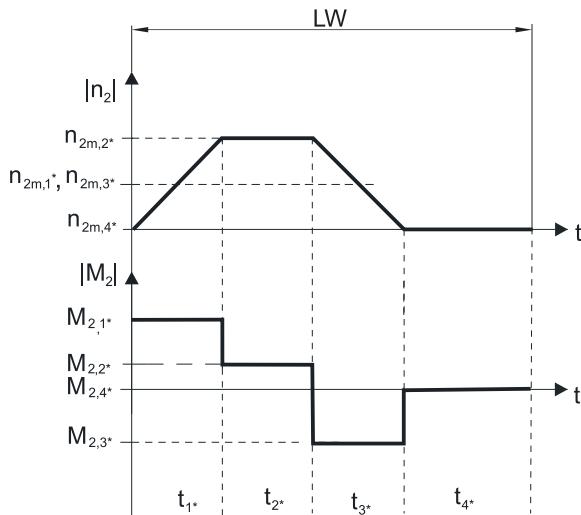

Calculate the forces and tilting torques in the chapter Permitted shaft loads.

Refer to the selection tables for the values for i , $n_{1\text{maxDB}}$, $n_{1\text{maxZB}}$, $M_{2\text{acc}}$ ($M_{2\text{accHT}}$ for reduced backlash), $M_{2\text{NOT}}$ and M_{2N} .

The values for fB_T , fB_{op} , fB_t and fB_ZB can be found in the corresponding tables in this chapter.

Example of cyclic operation

The following calculations are based on a representation of the power taken from the output based in accordance with the following example:

Calculation of the actual maximum acceleration torque

$$M_{2\text{acc}*} = J_{\text{tot}} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L*}$$

Calculation of the actual average input speed

$$n_{1m*} = n_{2m*} \cdot i$$

$$n_{2m*} = \frac{|n_{2m,1*}| \cdot t_{1*} + \dots + |n_{2m,n*}| \cdot t_{n*}}{t_{1*} + \dots + t_{n*}}$$

If $t_{1*} + \dots + t_{3*} \geq 6 \text{ min}$, calculate n_{2m*} without the rest phase t_{4*} .

The values for the ratio i can be found in the selection tables.

Calculation of the actual emergency-off torque

$$M_{2\text{NOT}*} = J_{\text{tot}} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L*}$$

Calculation of the actual equivalent torque

$$M_{2\text{eq}*} = \sqrt[3]{\frac{|n_{2m,1*}| \cdot t_{1*} \cdot |M_{2,1*}|^3 + \dots + |n_{2m,n*}| \cdot t_{n*} \cdot |M_{2,n*}|^3}{|n_{2m,1*}| \cdot t_{1*} + \dots + |n_{2m,n*}| \cdot t_{n*}}}$$

8.6.2 Permitted shaft loads for the output shaft

The values specified in the tables apply to the permitted shaft loads:

- For shaft dimensions in accordance with the catalog
- For output speeds $n_{2m^*} \leq 100$ rpm ($F_{2axN} = F_{2ax100}$; $F_{2radN} = F_{2rad100}$; $M_{2kN} = M_{2k100}$)
- Only if radial forces on the gear unit are stabilized by its pilots (housing, flange shaft)

For other output speeds, download diagrams at <http://configurator.stoeber.de>.

The following applies to output speeds $n_{2m^*} > 100$ rpm:

$$F_{2axN} = \frac{F_{2ax100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$F_{2radN} = \frac{F_{2rad100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

The values for F_{2ax100} , $F_{2rad100}$ and M_{2k100} can be found in the table "Permitted shaft loads" in this chapter.

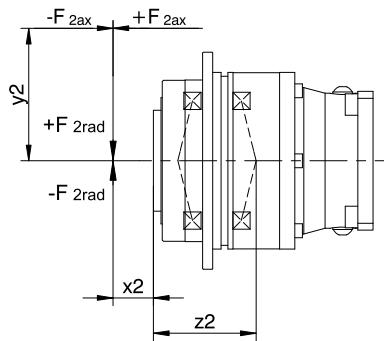

Fig. 2: Force application points

You can determine the permitted radial forces from the permitted breakdown torque M_{2kN} and $M_{2k,acc}$. The actual radial forces may not exceed the permitted radial forces. The permitted radial forces pertain to the shaft end ($x_2 = 0$).

$$M_{2k,acc^*} = \frac{2 \cdot F_{2ax^*} \cdot y_2 + F_{2rad,acc^*} \cdot (x_2 + z_2)}{1000} \leq M_{2k,acc}$$

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for F_{2ax100} , $F_{2rad100}$ and M_{2k100} by a factor of two.

Also note the calculation for equivalent values:

$$M_{2k,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2k,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2k,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq M_{2kN}$$

$$F_{2rad,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |F_{2rad,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |F_{2rad,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq F_{2radN}$$

$$F_{2ax,eq^*} \leq F_{2axN}$$

The following apply to the bearing service life L_{10h} ($ED_{10} \leq 40\%$):

$L_{10h} > 10000$ h with $1 < M_{2kN}/M_{2k^*} < 1.25$

$L_{10h} > 20000$ h with $1.25 < M_{2kN}/M_{2k^*} < 1.5$

$L_{10h} > 30000$ h with $1.5 < M_{2kN}/M_{2k^*}$

For different duty cycles:

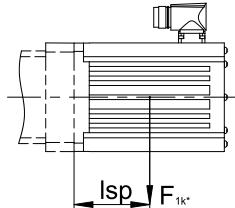

$$L_{10h} > L_{10h(ED_{10}=40\%)} \cdot \frac{40\%}{ED_{10}}$$

8.6.3 Permitted breakdown torques at the gear unit input

For a horizontal mounting position of the motor, verify that the permitted breakdown torque at the gear unit input is not exceeded before installation on a STOBER gear unit. You can find information for how to do that in this chapter.

Calculate the actual breakdown torque as follows:

$$M_{1k^*} = F_{1k^*} \cdot l_{sp} \leq M_{1k}$$

Type	M_{1k} [Nm]
MB23	45
MB33	90
MB43	200
MB53	450

8.6.4 Recommendation for radial shaft seal rings

For a duty cycle > 60% and higher surrounding temperatures, we recommend radial shaft seal rings made of FKM at the output.

Properties:

- Excellent temperature resistance
- High chemical stability
- Very good resistance to aging
- Excellent resistance to mineral oils and greases
- For use in the food, beverage and pharmaceutical industries

Leak-proofness

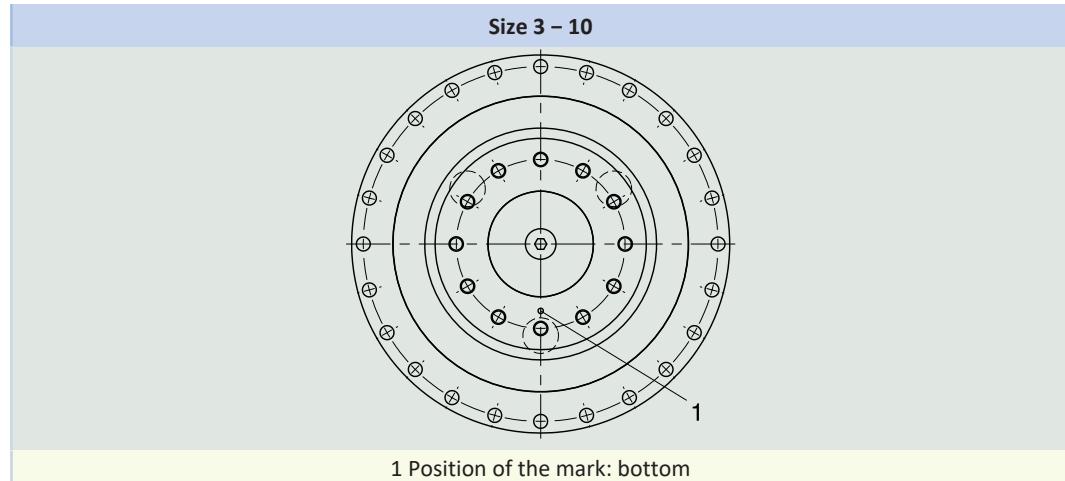

Our gear units are equipped with high-quality radial shaft seal rings and checked for leaks. However, a leak cannot be fully ruled out over the length of use of a gear unit. If you use a gear unit with goods incompatible with the lubricant, you must take measures to prevent direct contact with the gear unit lubricant in case of a leak.

8.6.5 Reverse operation

To ensure lubrication for circulating gearing parts during cyclic reverse operation from $\pm 20^\circ$ to $\pm 90^\circ$ at the output, pay careful attention to the position of the output shaft for the horizontal mounting of the gear unit, as shown in the diagrams below.

The images show the center position of reverse operation.

Cyclic reverse operation $\leq \pm 20^\circ$ on request.

Please note that the hole pattern may be different, depending on the size of the planetary gear unit.

9.3 Dimensional drawings

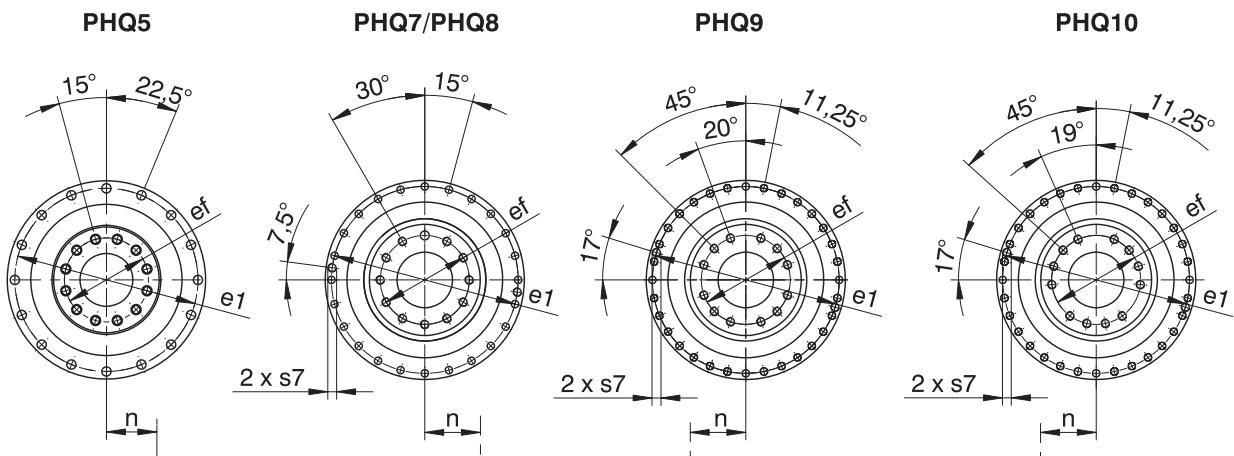

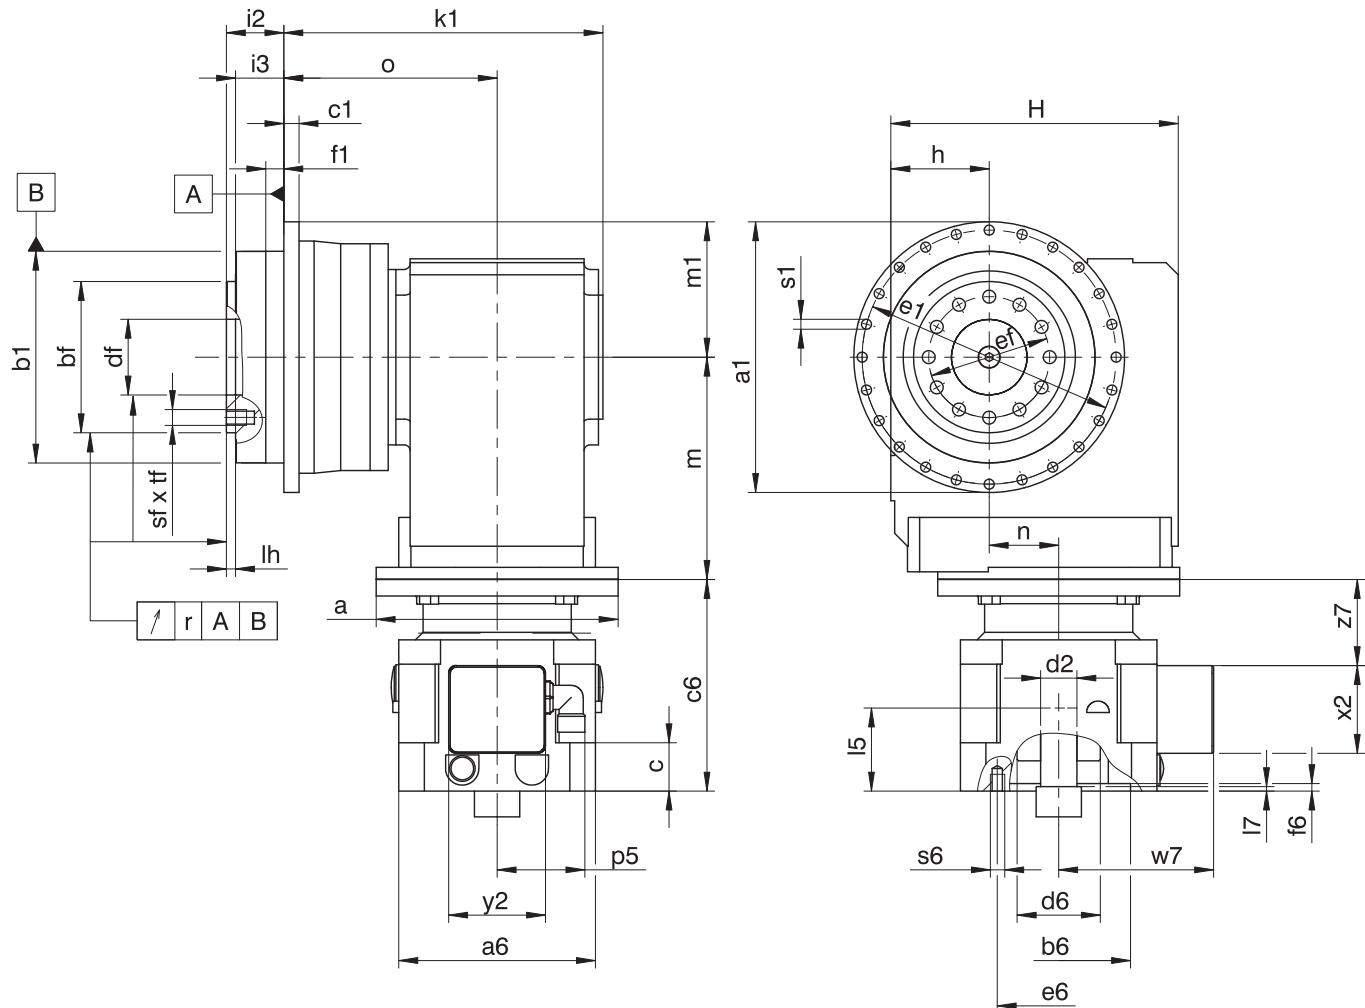

In this chapter, you can find the dimensions of the gear units as well as example dimensions of the mountable motor adapters.

Dimensions can exceed the specifications of ISO 2768-mK due to casting tolerances or accumulation of individual tolerances.

We reserve the right to make dimensional changes due to ongoing technical development.

You can download 3D models of our standard drives at <http://configurator.stoeber.de>.

Fig. 1: Motor adapter with ServoStop brake

9.5.2.2 Brake

A failsafe brake is integrated into the motor adapter. It has the function of a holding brake. Braking from full speed, e.g. in case of a voltage drop or an emergency off in hazard situations, is still possible.

The brake can be used as a single brake or together with the motor brake as a redundant brake system.

Function

The brakes installed in the motor adapter are electrically actuated spring-loaded brakes for dry running. In the de-energized state, braking takes place using spring force. The brake is released by an electromagnetic DC coil before the motor is switched on. The switch-on time t_{2B} (release time) is the time until the anchor plate releases from the axially moving brake disc and is magnetically held to the coil body. In this state, the brake is released and the coupling hub can rotate. In order to switch off (motor and brake), the residual magnetic flux of the iron parts (anchor and coil body) must be reduced; the associated time t_{1B} until the start of torque generation is defined as a response delay when linking. The link time t_{1B} is the time until the braking torque has built up to the nominal braking torque.

Manual release

Optionally, the brake can be equipped with a manual release.

Pressing the manual release deactivates the electronic actuation of the brake. Before pressing the manual release, you must establish the safety of the machine (e.g. protection against falling).

9.5.2.3 Electrical connection

- Terminal box (standard)
- Plug connector (optional, not possible in combination with release monitoring)

9.5.2.4 Monitoring

For monitoring the brake system, there are generally two options:

- Manual monitoring of wear via air gap checks with a feeler gauge
- Electrical release monitoring in the terminal box with a non-contact and wear-free proximity switch

9.5.3 Installation conditions

The torque and force values listed in this catalog are valid under the following conditions:

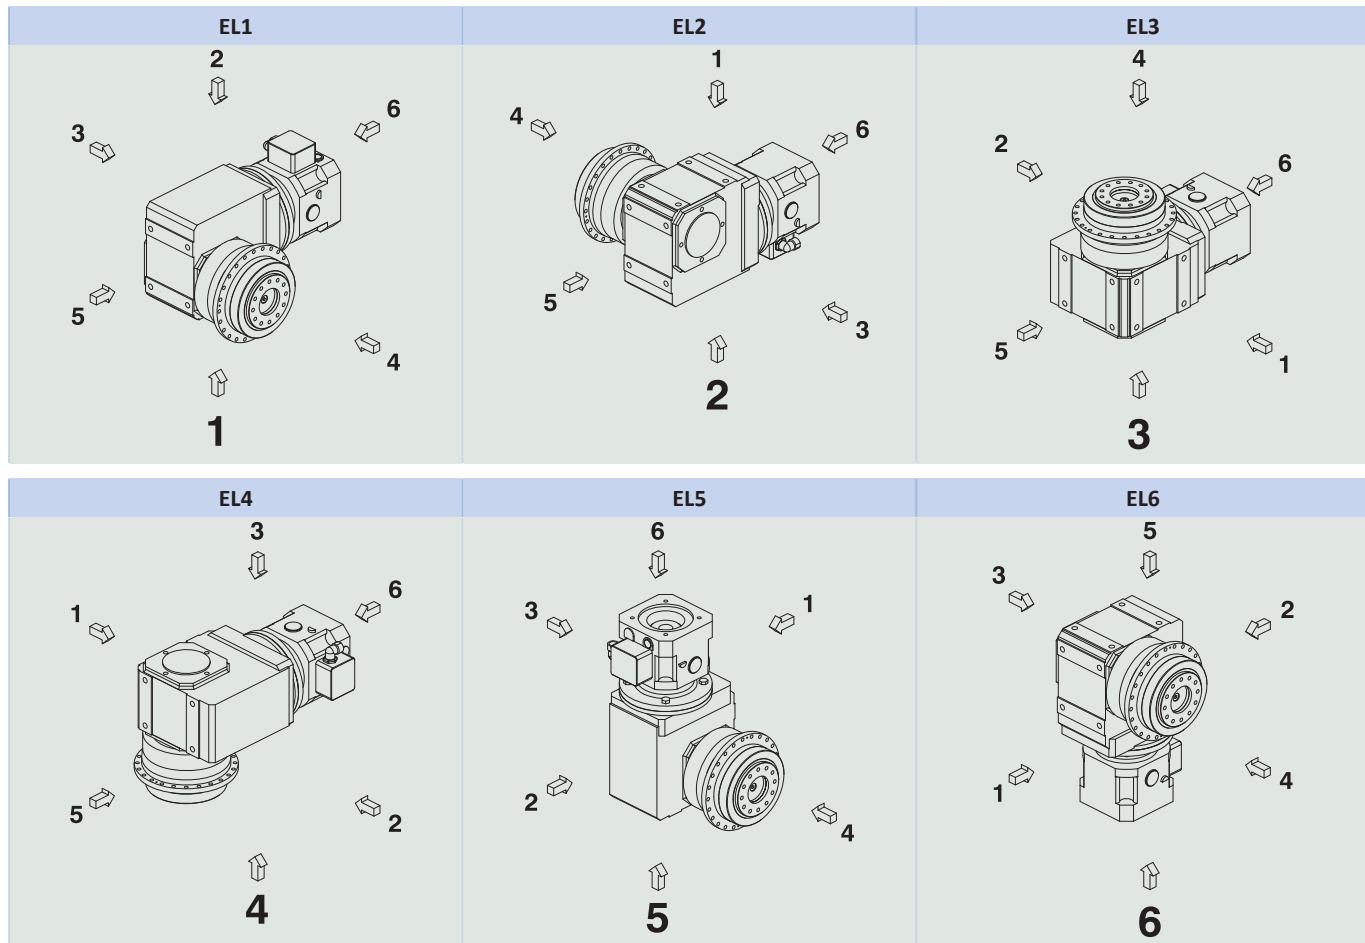

- When the flange shaft and gear housing are fastened on the machine side using screws of strength class 12.9
- When the gear housings are adjusted at pilot $\phi b1$. The machine-side fit must be H7.
- When the flange shaft is adjusted using the connecting element at pilot ϕbf or ϕdf

9.5.4 Mounting positions

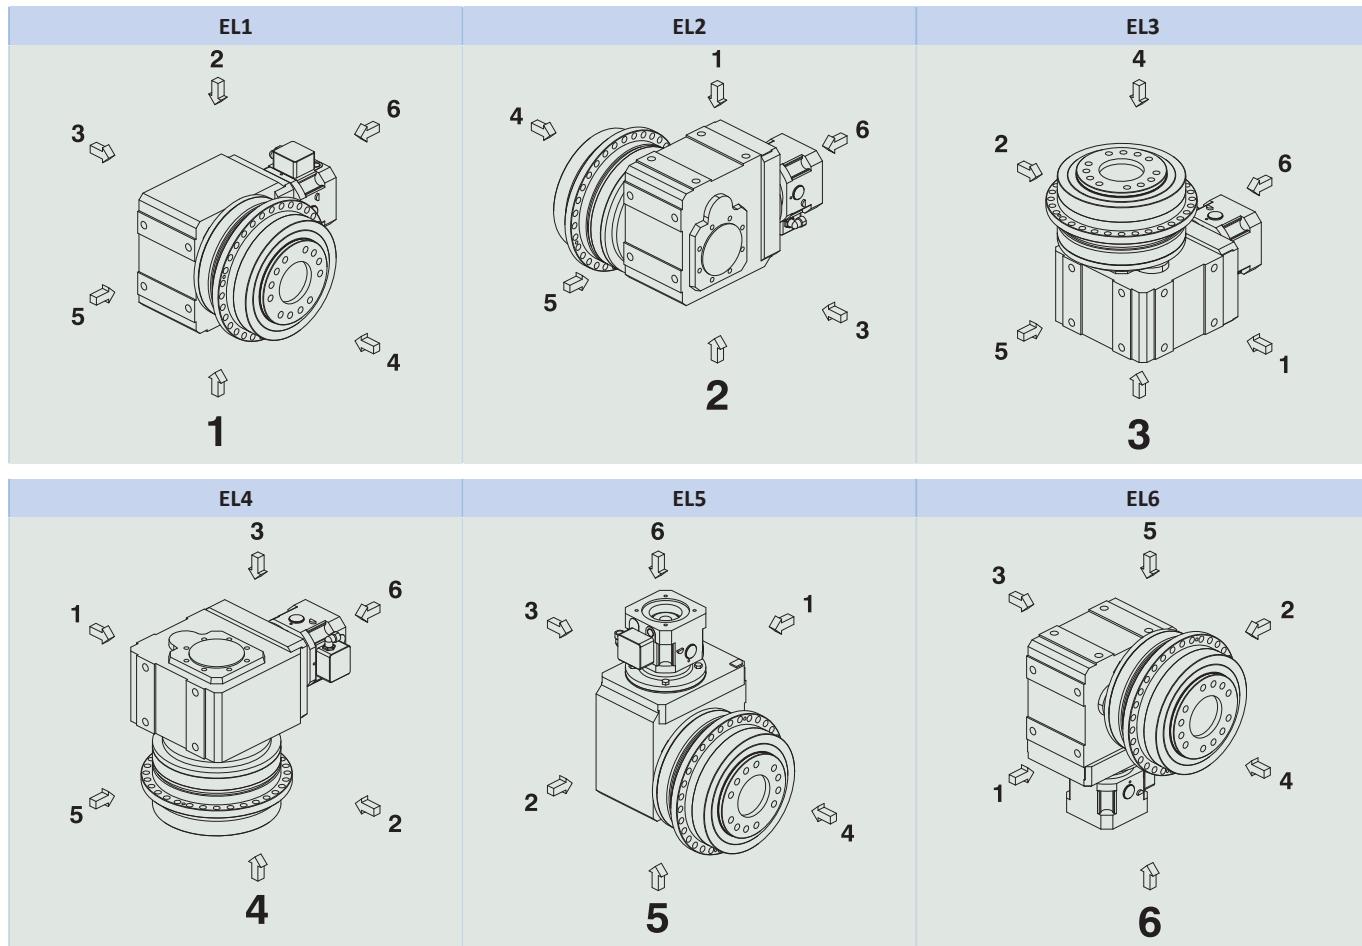

The following table shows the standard mounting positions.

The numbers identify the gear unit sides. The mounting position is defined by the gear side facing downwards.

PHQ5K1 – PHQ8K4

PHQ9K5 – PHQ12K9

Since the lubricant filling volume of the gear unit depends on the mounting position, the mounting position must be specified when ordering.

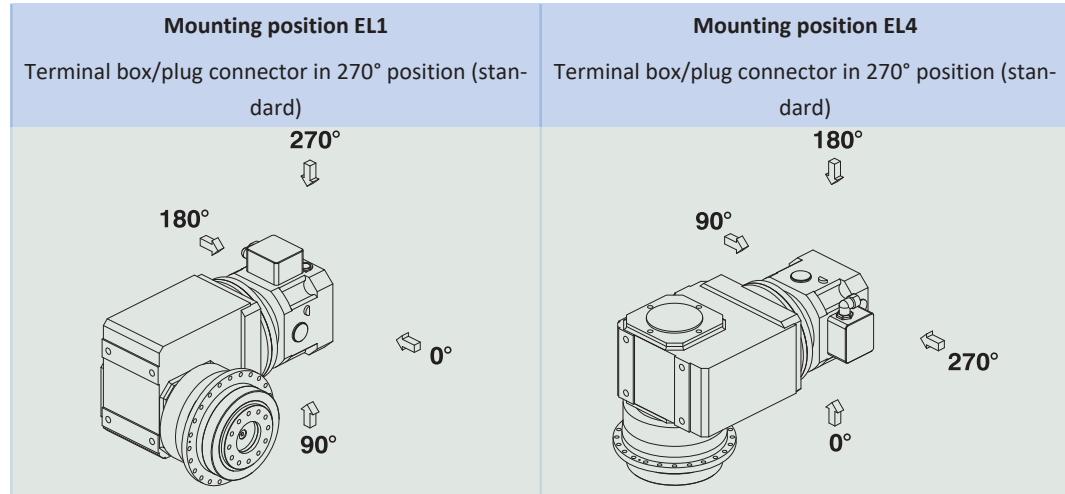

9.5.5 Lubricants

STOBER fills the gear units with the amount and type of lubricant specified on the nameplate. The filling volume and the structure of the gear units depend on the mounting position.

Only install the gear units in the intended mounting position! Reposition the gear units only after consulting STOBER. Otherwise, STOBER assumes no liability for the gear units.

You will receive lubricants for use in the food industry upon request.

9.5.6 Position of the terminal box/plug connector

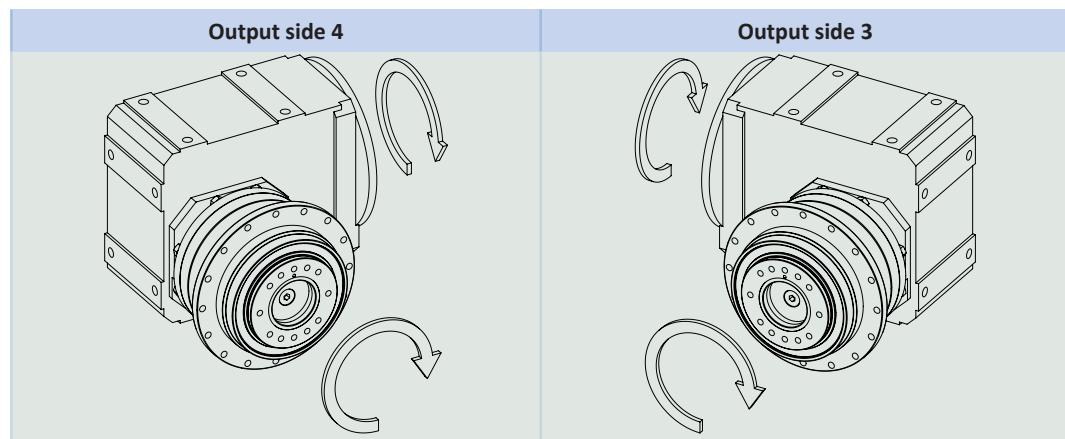

Indicate variations for your gear unit in the purchase order.

Note that the terminal box/plug connector position rotates along with the gear unit if the geared motor is in another mounting position.

9.6.1 Drive selection

The formula symbols for values actually present in the application are marked with *.

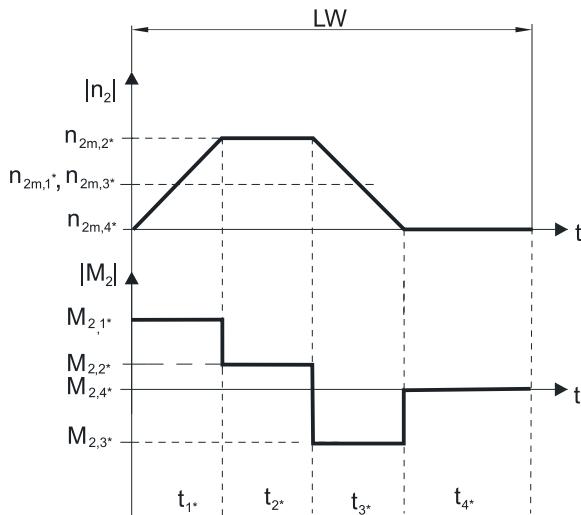

Calculate the forces and tilting torques in the chapter Permitted shaft loads.

Refer to the selection tables for the values for i , $n_{1\text{maxDB}}$, $n_{1\text{maxZB}}$, $M_{2\text{acc}}$ ($M_{2\text{accHT}}$ for reduced backlash), $M_{2\text{NOT}}$ and M_{2N} .

The values for fB_T , fB_{op} , fB_t and fB_ZB can be found in the corresponding tables in this chapter.

Example of cyclic operation

The following calculations are based on a representation of the power taken from the output based in accordance with the following example:

Calculation of the actual maximum acceleration torque

$$M_{2\text{acc}^*} = J_{\text{tot}} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual average input speed

$$n_{1m^*} = n_{2m^*} \cdot i$$

$$n_{2m^*} = \frac{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}{t_{1^*} + \dots + t_{n^*}}$$

If $t_{1^*} + \dots + t_{3^*} \geq 6 \text{ min}$, calculate n_{2m^*} without the rest phase t_{4^*} .

The values for the ratio i can be found in the selection tables.

Calculation of the actual emergency-off torque

$$M_{2\text{NOT}^*} = J_{\text{tot}} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual equivalent torque

$$M_{2\text{eq}^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}}$$

9.6.2 Permitted shaft loads for the output shaft

The values specified in the tables apply to the permitted shaft loads:

- For shaft dimensions in accordance with the catalog
- For output speeds $n_{2m^*} \leq 100$ rpm ($F^{2axN} = F_{2ax100}$; $F_{2radN} = F_{2rad100}$; $M_{2kN} = M_{2k100}$)
- Only if radial forces on the gear unit are stabilized by its pilots (housing, flange shaft)

For other output speeds, download diagrams at <http://configurator.stoeber.de>.

The following applies to output speeds $n_{2m^*} > 100$ rpm:

$$F_{2axN} = \frac{F_{2ax100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$F_{2radN} = \frac{F_{2rad100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k100}}{\sqrt[3]{\frac{n_{2m^*}}{100 \text{ rpm}}}}$$

The values for F_{2ax100} , $F_{2rad100}$ and M_{2k100} can be found in the table "Permitted shaft loads" in this chapter.

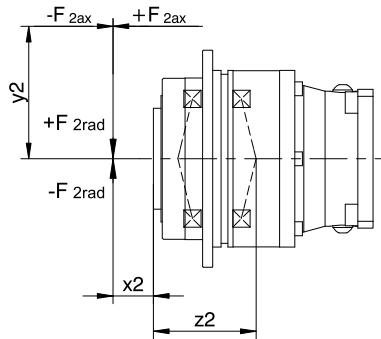

Fig. 2: Force application points

You can determine the permitted radial forces from the permitted breakdown torque M_{2kN} and $M_{2k,acc}$. The actual radial forces may not exceed the permitted radial forces. The permitted radial forces pertain to the shaft end ($x_2 = 0$).

$$M_{2k,acc^*} = \frac{2 \cdot F_{2ax^*} \cdot y_2 + F_{2rad,acc^*} \cdot (x_2 + z_2)}{1000} \leq M_{2k,acc}$$

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for F_{2ax100} , $F_{2rad100}$ and M_{2k100} by a factor of two.

Also note the calculation for equivalent values:

$$M_{2k,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2k,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2k,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq M_{2kN}$$

$$F_{2rad,eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |F_{2rad,acc,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |F_{2rad,acc,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}} \leq F_{2radN}$$

$$F_{2ax,eq^*} \leq F_{2axN}$$

The following apply to the bearing service life L_{10h} ($ED_{10} \leq 40\%$):

$$L_{10h} > 10000 \text{ h with } 1 < M_{2kN}/M_{2k^*} < 1.25$$

$$L_{10h} > 20000 \text{ h with } 1.25 < M_{2kN}/M_{2k^*} < 1.5$$

$$L_{10h} > 30000 \text{ h with } 1.5 < M_{2kN}/M_{2k^*}$$

For different duty cycles:

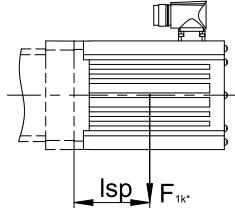

$$L_{10h} > L_{10h(ED_{10}=40\%)} \cdot \frac{40\%}{ED_{10}}$$

9.6.3 Permitted breakdown torques at the gear unit input

For a horizontal mounting position of the motor, verify that the permitted breakdown torque at the gear unit input is not exceeded before installation on a STOBER gear unit. You can find information for how to do that in this chapter.

Calculate the actual breakdown torque as follows:

$$M_{1k^*} = F_{1k^*} \cdot l_{sp} \leq M_{1k}$$

9.6.4 Recommendation for radial shaft seal rings

For a duty cycle > 60% and higher surrounding temperatures, we recommend radial shaft seal rings made of FKM at the output.

Properties:

- Excellent temperature resistance
- High chemical stability
- Very good resistance to aging
- Excellent resistance to mineral oils and greases
- For use in the food, beverage and pharmaceutical industries

Leak-proofness

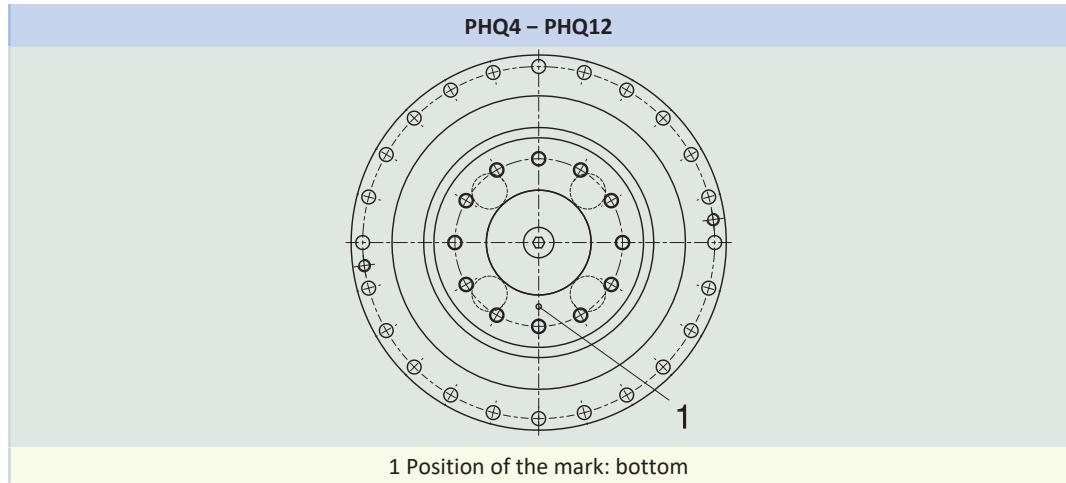

Our gear units are equipped with high-quality radial shaft seal rings and checked for leaks. However, a leak cannot be fully ruled out over the length of use of a gear unit. If you use a gear unit with goods incompatible with the lubricant, you must take measures to prevent direct contact with the gear unit lubricant in case of a leak.

9.6.5 Reverse operation

To ensure lubrication for circulating gearing parts during cyclic reverse operation from $\pm 20^\circ$ to $\pm 90^\circ$ at the output, pay careful attention to the position of the output shaft for the horizontal mounting of the gear unit, as shown in the diagrams below.

The images show the center position of reverse operation.

Cyclic reverse operation $\leq \pm 20^\circ$ on request.

Please note that the hole pattern may be different, depending on the size of the planetary gear unit.

10.3 Dimensional drawings

In this chapter, you can find the dimensions of the gear units as well as example dimensions of the mountable motor adapters.

Dimensions can exceed the specifications of ISO 2768-mK due to casting tolerances or accumulation of individual tolerances.

We reserve the right to make dimensional changes due to ongoing technical development.

You can download 3D models of our standard drives at <http://configurator.stoeber.de>.

In this chapter, you will find the description and technical data of the motor adapter with brake.

10.5.2.1 Properties

- Electrically actuated spring-loaded brake for dry running
- Featuring backlash-free plug-in coupling (jaw coupling) for easy removal of the motor with the axis braked in any position
- Electrical release monitoring in the terminal box of the motor adapter
- Manual monitoring of wear via air gap checks with a feeler gauge
- As a single brake or together with the motor brake as a redundant brake system
- Manual release (optional)

Fig. 1: Motor adapter with ServoStop brake

10.5.2.2 Brake

A failsafe brake is integrated into the motor adapter. It has the function of a holding brake. Braking from full speed, e.g. in case of a voltage drop or an emergency off in hazard situations, is still possible.

The brake can be used as a single brake or together with the motor brake as a redundant brake system.

Function

The brakes installed in the motor adapter are electrically actuated spring-loaded brakes for dry running. In the de-energized state, braking takes place using spring force. The brake is released by an electromagnetic DC coil before the motor is switched on. The switch-on time t_{2B} (release time) is the time until the anchor plate releases from the axially moving brake disc and is magnetically held to the coil body. In this state, the brake is released and the coupling hub can rotate. In order to switch off (motor and brake), the residual magnetic flux of the iron parts (anchor and coil body) must be reduced; the associated time t_{1B} until the start of torque generation is defined as a response delay when linking. The link time t_{1B} is the time until the braking torque has built up to the nominal braking torque.

Manual release

Optionally, the brake can be equipped with a manual release.

Pressing the manual release deactivates the electronic actuation of the brake. Before pressing the manual release, you must establish the safety of the machine (e.g. protection against falling).

10.5.2.3 Electrical connection

- Terminal box (standard)
- Plug connector (optional, not possible in combination with release monitoring)

10.5.2.4 Monitoring

For monitoring the brake system, there are generally two options:

- Manual monitoring of wear via air gap checks with a feeler gauge
- Electrical release monitoring in the terminal box with a non-contact and wear-free proximity switch

10.5.5 Installation conditions

Hollow shaft

The hollow shaft hole tolerance is ISO H7. The tolerance of the machine shaft must be ISO k6.

Take care to align the machine shaft with the gear unit hollow shaft when attaching the gear unit.

Maximum deviation ≤ 0.03 mm.

For simpler assembly and disassembly of the machine shaft, the hollow shafts are equipped with a spiral groove (as a grease deposit).

A hardened, threaded keeper plate is included in the scope of delivery. You also have the option to order the hollow shaft without a keeper plate.

Hollow shaft with shrink ring

The tolerance of the hollow shaft hole is ISO H7.

The machine shaft must be executed as follows:

Gear unit type	Tolerance
K1 to K6	ISO h9
K7 to K10	ISO h6

Select a material for the machine shaft with a permitted surface pressure of $p \geq 325 \text{ N/mm}^2$.

Possible materials:

- C45E +QT
- 42CrMo4

Fastening the gear units on the machine side using the pitch circle diameter

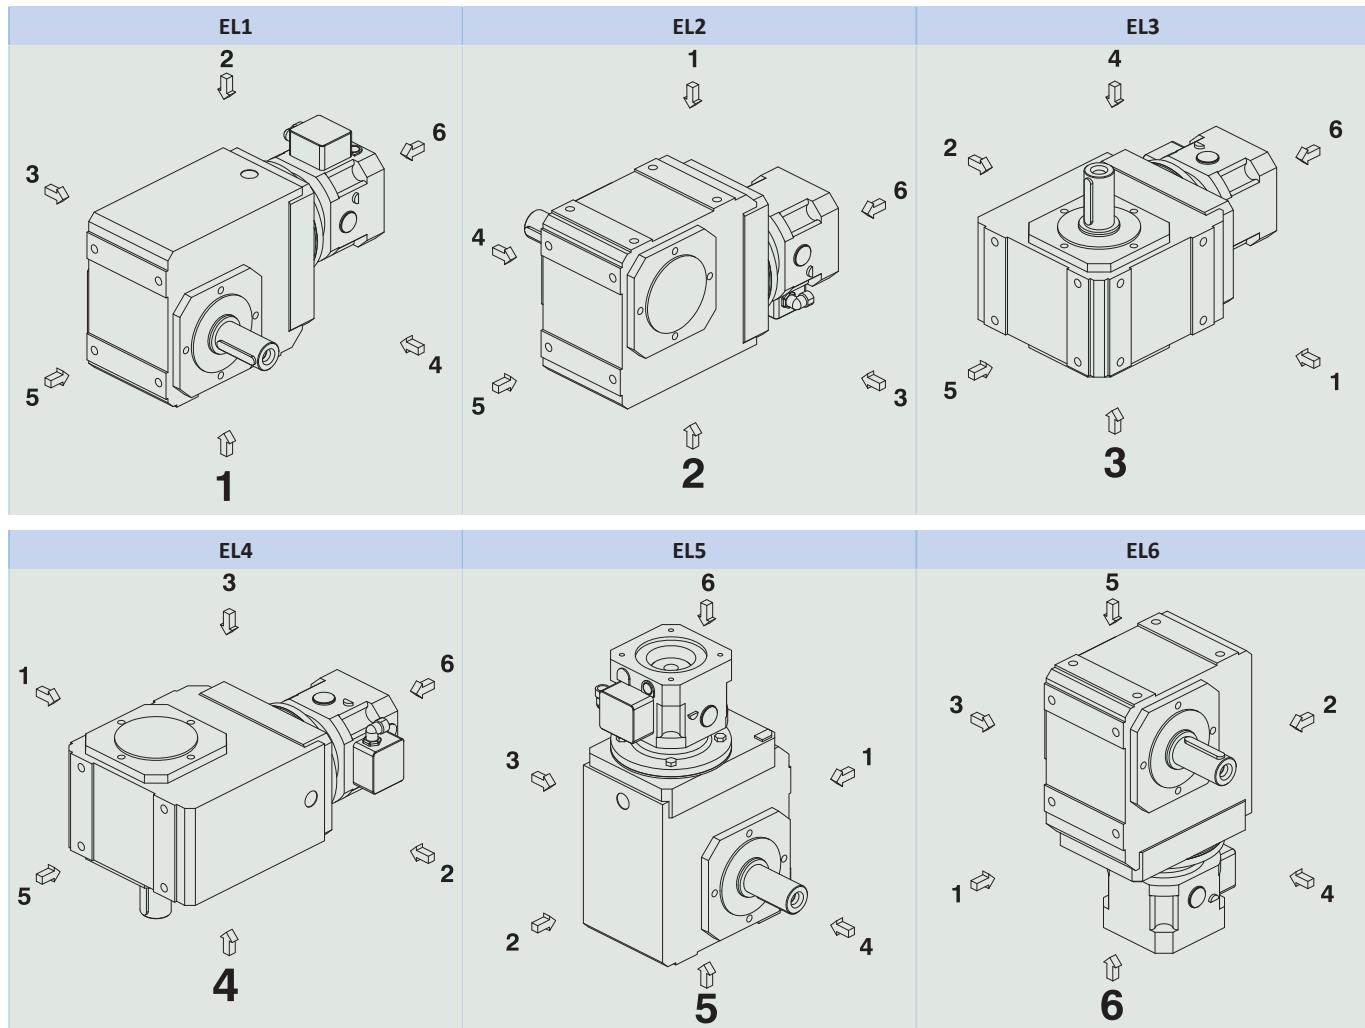

The specified torques and forces only apply when gear units are fastened on the machine side using screws of strength class 10.9. In addition, the gear housings must be adjusted at the pilot. The machine-side fit must be H7.

10.5.6 Mounting positions

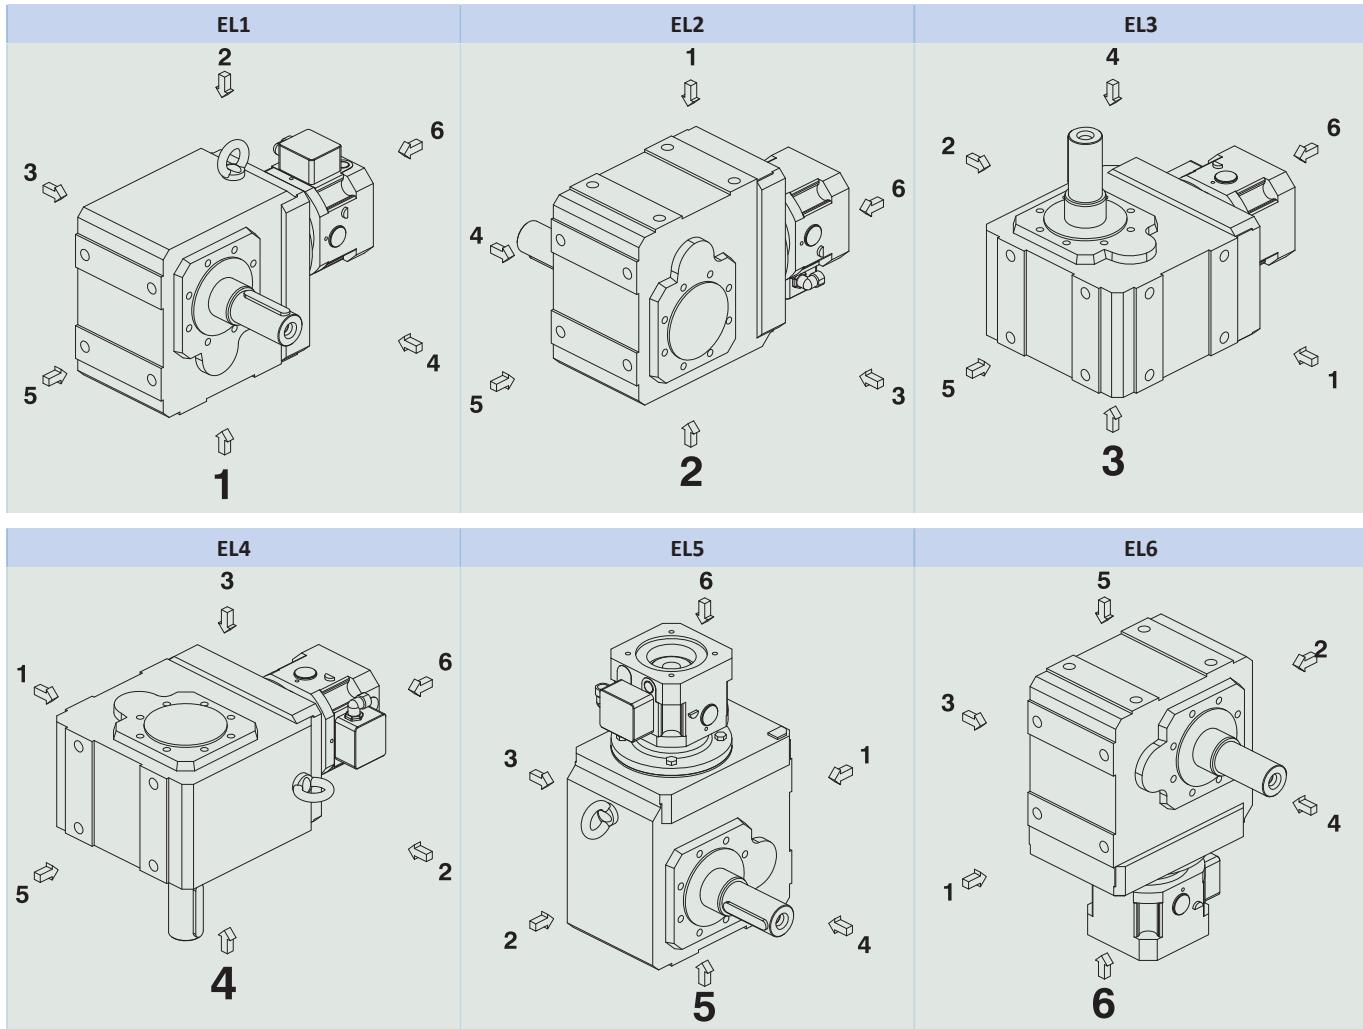

The following table shows the standard mounting positions.

The numbers identify the gear unit sides. The mounting position is defined by the gear side facing downwards.

Mounting positions for gear unit sizes K1 – K4

Mounting positions for gear unit sizes K5 – K10

Since the lubricant filling volume of the gear unit depends on the mounting position, the mounting position must be specified when ordering.

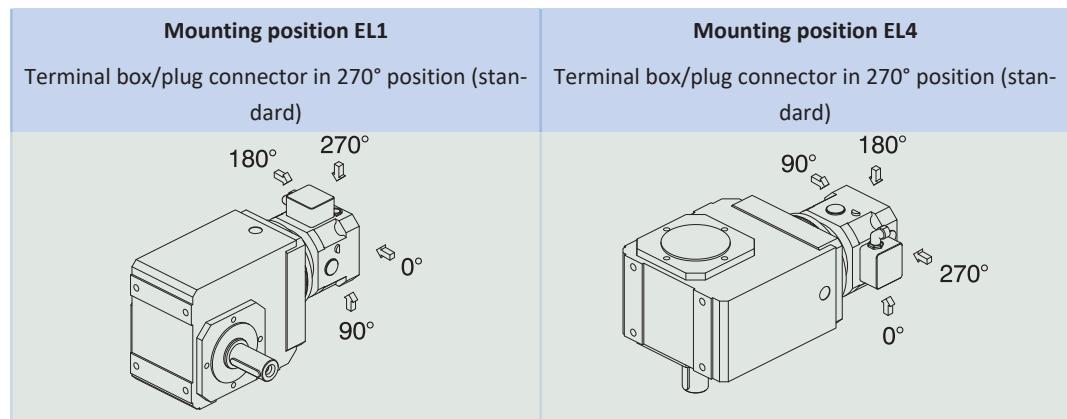

10.5.7 Lubricants

STOBER fills the gear units with the amount and type of lubricant specified on the nameplate. The filling volume and the structure of the gear units depend on the mounting position.

Only install the gear units in the intended mounting position! Reposition the gear units only after consulting STOBER. Otherwise, STOBER assumes no liability for the gear units.

You will receive lubricants for use in the food industry upon request.

10.5.8 Position of the terminal box/plug connector

Indicate variations for your gear unit in the purchase order.

Note that the terminal box/plug connector position rotates along with the gear unit if the geared motor is in another mounting position.

10.6 Project configuration

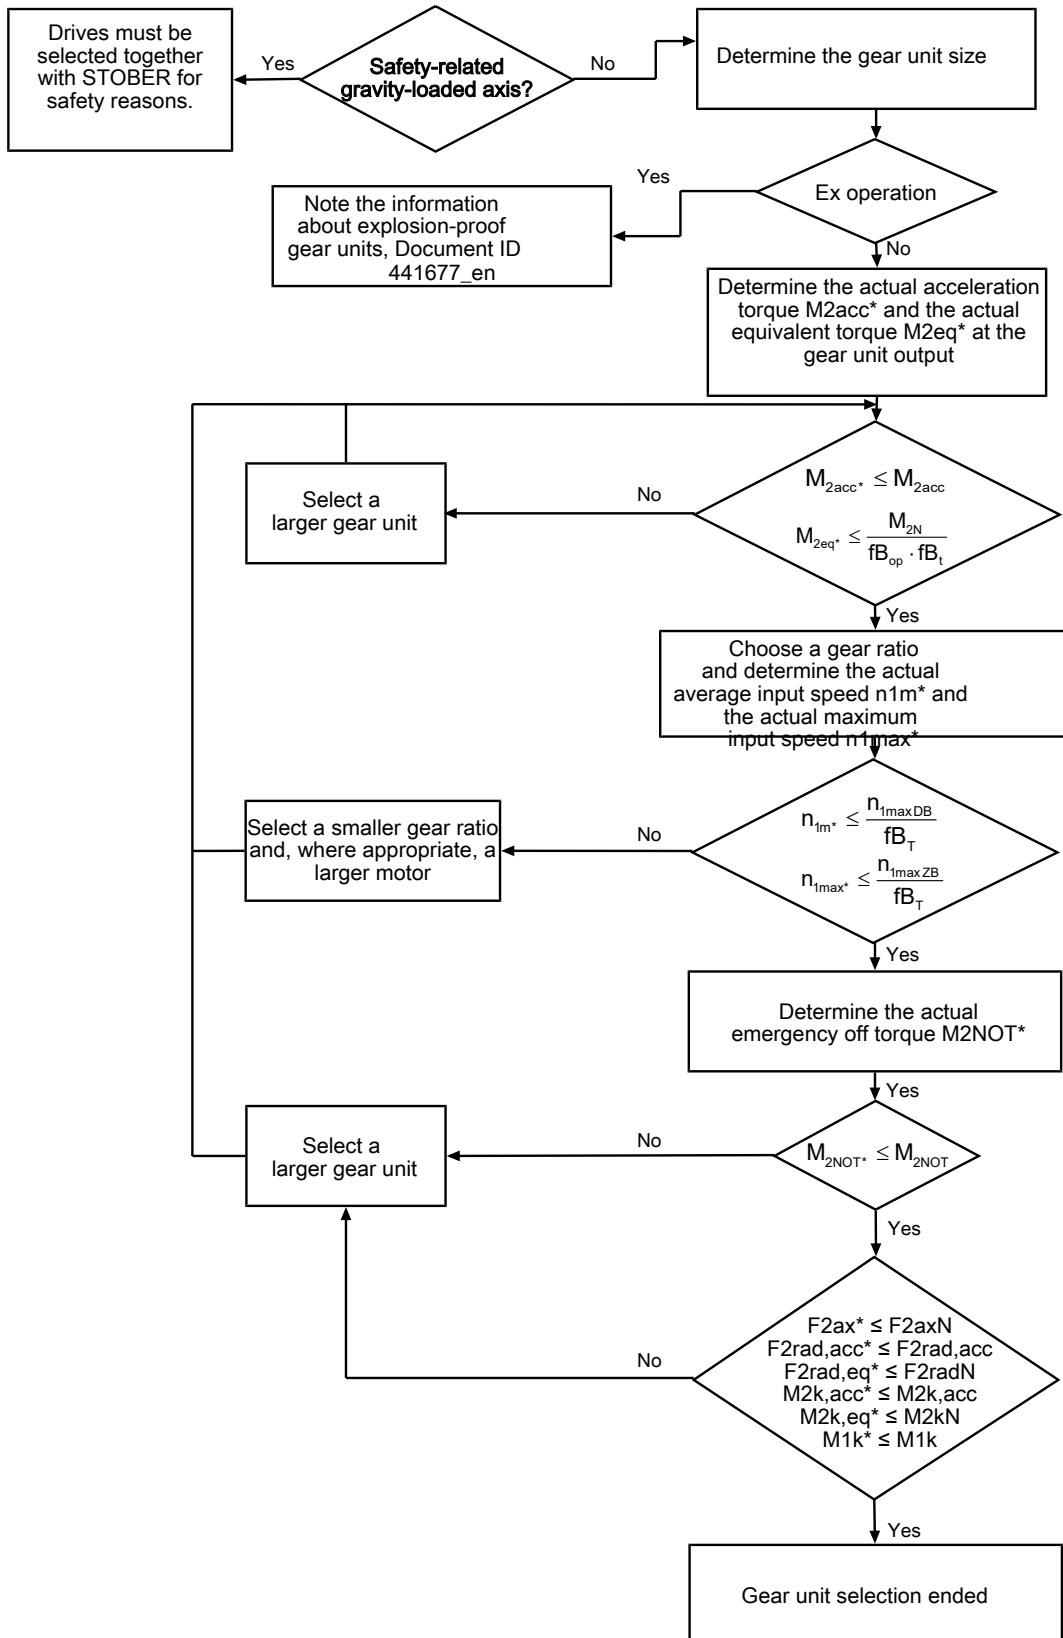

Project your drives using our SERVOsoft designing software. Download SERVOsoft for free at <https://www.stoeber.de/en/ServoSoft>.

Observe the limit conditions in this chapter to ensure a safe design for your drives.

An explanation of the formula symbols can be found in the chapter Formula symbols.

10.6.1 Drive selection

The formula symbols for values actually present in the application are marked with *.

Calculate the forces and tilting torques in the chapter Permitted shaft loads.

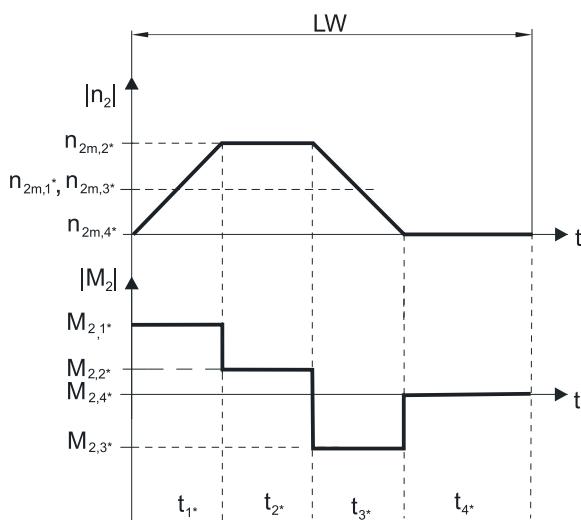

The values for i , n_{1maxDB} , n_{1maxZB} , M_{1Bstat} , M_{2acc} , M_{2NOT} and M_{2N} can be found in selection tables.

The values for the available maximum motor brake torque $M_{M,Bmax}^*$ can be found in the manufacturer catalog.

The values for fB_t , fB_{op} and fB_t can be found in the corresponding tables in this chapter.

Example of cyclic operation

The following calculations are based on a representation of the power taken from the output based in accordance with the following example:

Calculation of the actual maximum acceleration torque

$$M_{2acc^*} = J_{tot} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual average input speed

$$n_{1m^*} = n_{2m^*} \cdot i$$

$$n_{2m^*} = \frac{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}{t_{1^*} + \dots + t_{n^*}}$$

If $t_{1^*} + \dots + t_{3^*} \geq 6$ min, calculate n_{2m^*} without the rest phase t_{4^*} .

The values for the ratio i can be found in the selection tables.

Calculation of the actual emergency-off torque

$$M_{2NOT^*} = J_{tot} \cdot \frac{\Delta n_2}{9.55 \cdot \Delta t} + M_{L^*}$$

Calculation of the actual equivalent torque

$$M_{2eq^*} = \sqrt[3]{\frac{|n_{2m,1^*}| \cdot t_{1^*} \cdot |M_{2,1^*}|^3 + \dots + |n_{2m,n^*}| \cdot t_{n^*} \cdot |M_{2,n^*}|^3}{|n_{2m,1^*}| \cdot t_{1^*} + \dots + |n_{2m,n^*}| \cdot t_{n^*}}}$$

10.6.2 Permitted shaft loads for the output shaft

The values specified in the tables apply to the permitted shaft loads:

- For shaft dimensions in accordance with the catalog
- For output speeds $n_{2m^*} \leq 20 \text{ rpm}$ ($F_{2axN} = F_{2ax20}$; $F_{2radN} = F_{2rad20}$; $M_{2kN} = M_{2k20}$)
- Only if radial forces on the gear unit are stabilized by its pilots for the pitch circle diameter and flange housing design

Reduced values apply in the case of a V shaft design (solid shaft) in conjunction with an NF housing design (foot + round flange):

K10	132.0	25000	64000	64000	15200	15200

For the V solid shaft design on both sides, the values for F_{2rad20} and M_{2k20} must be multiplied by a factor of 0.7.

For other output speeds, download diagrams at <http://configurator.stoeber.de>.

The following applies to output speeds $n_{2m^*} > 20 \text{ rpm}$:

$$F_{2axN} = \frac{F_{2ax20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

$$F_{2radN} = \frac{F_{2rad20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

The values for F_{2ax20} , F_{2rad20} and M_{2k20} can be found in the table "Permitted shaft loads" in this chapter.

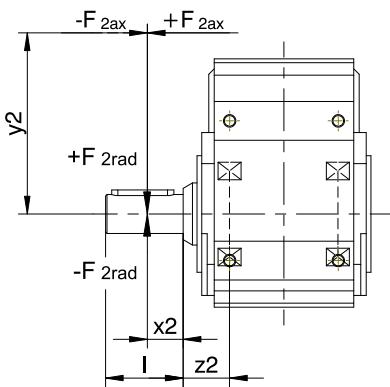

Fig. 2: Force application points for solid shaft

The specified values for $F_{2\text{rad}20}$ are based on application of force at the middle of the output shaft: $x_2 = l/2$.

Shaft dimensions can be found in the "Dimensional drawings" chapter.

The following applies to other force application points:

$$M_{2k^*} = \frac{2 \cdot F_{2\text{ax}*} \cdot y_2 + F_{2\text{rad}*} \cdot (x_2 + z_2)}{1000} \leq M_{2kN}$$

$$F_{2\text{rad}*} \leq F_{2\text{radN}}$$

$$F_{2\text{ax}*} \leq F_{2\text{axN}}$$

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for $F_{2\text{ax}20}$, $F_{2\text{rad}20}$ and M_{2k20} by a factor of two.

The following applies to output speeds $n_{2m^*} > 20 \text{ rpm}$:

$$F_{2axN} = \frac{F_{2ax20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

$$M_{2kN} = \frac{M_{2k20}}{\sqrt[3]{\frac{n_{2m^*}}{20 \text{ rpm}}}}$$

The values for F_{2ax20} , F_{2rad20} and M_{2k20} can be found in the table "Permitted shaft loads" in this chapter.

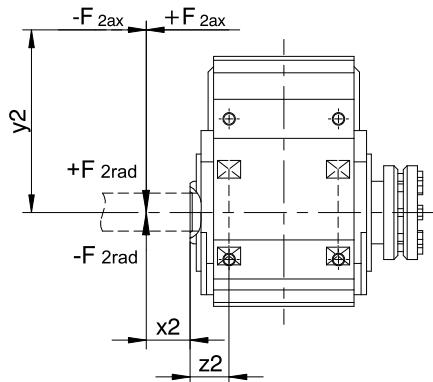

Fig. 3: Force application points for hollow shaft

You can determine the permitted radial forces from the permitted breakdown torque M_{2kN} . The actual radial forces may not exceed the permitted radial forces. The permitted radial forces pertain to the shaft end ($x_2 = 0$).

$$M_{2k^*} = \frac{2 \cdot F_{2ax^*} \cdot y_2 + F_{2rad^*} \cdot (x_2 + z_2)}{1000} \leq M_{2kN}$$

$$F_{2ax^*} \leq F_{2axN}$$

For applications with multiple axial and/or radial forces, you must add the forces as vectors.

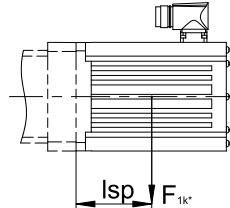

In the event of EMERGENCY OFF operation (max. 1000 load changes), you can multiply the permitted forces and torques for F_{2ax20} , F_{2rad20} and M_{2k20} by a factor of two.

10.6.3 Permitted breakdown torques at the gear unit input

For a horizontal mounting position of the motor, verify that the permitted breakdown torque at the gear unit input is not exceeded before installation on a STOBER gear unit. You can find information for how to do that in this chapter.

Calculate the actual breakdown torque as follows:

$$M_{1k^*} = F_{1k^*} \cdot l_{sp} \leq M_{1k}$$

10.6.4 Radial shaft seal rings

Leak-proofness

Our gear units are equipped with high-quality radial shaft seal rings and checked for leaks. However, a leak cannot be fully ruled out over the length of use of a gear unit. If you use a gear unit with goods incompatible with the lubricant, you must take measures to prevent direct contact with the gear unit lubricant in case of a leak.

10.6.5 Oil expansion tank

The gear units have a higher fill level in mounting position EL5. The oil expansion tank prevents oil from escaping out of the gear unit.

Notes

- We recommend using an oil expansion tank in mounting position EL5 (additional cost) for fast running gear units with an input speed $n_1 > 1750$ rpm and gear ratios $i < 20$.
- The oil expansion tank can only be used with certain sizes; see the chapter Oil expansion tank
